

VASTRANGAM
EDITION

Purchase is live — Procurement + Vendor
Management →

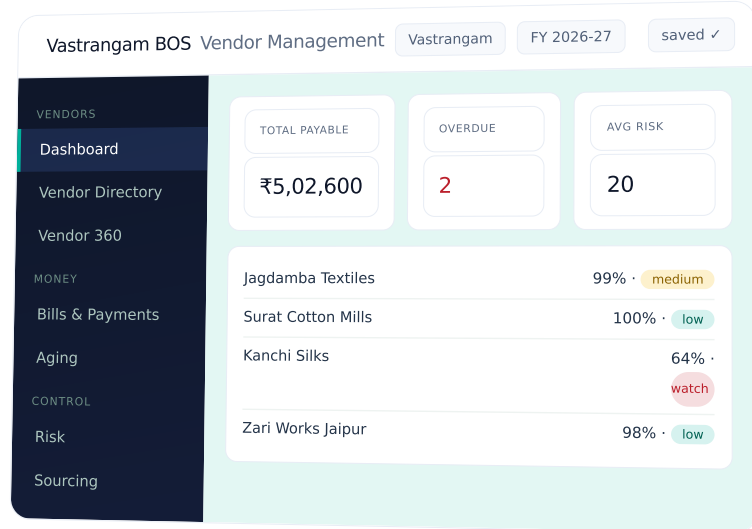

Run the whole ethnic wear house on one system

Mill to marketplace in one application. The metre you bought, the karigar who stitched it, the design that sold on Myntra, the return that came back damaged and the GST on all of it — one record, one stock number, one set of books. Nothing re-keyed between them.

Start free for 30 days

Modules, one login

113

Apps over one data core

1

Stock number for every SKU

7

Marketplaces connected

WHAT VASTRANGAM BOS IS

One application. Not eleven that talk to each other.

Every other suite sells you separate products and a sync job between them. Vastrangam BOS is a single application over one set of records — so there is nothing to synchronise, and nothing to reconcile.

1

Enter it once

A goods receipt, a counter sale, a marketplace order — recorded in one place. Stock, the ledger, the quality record and the supplier scorecard all update in the same instant, because they are reading the same record.

2

Numbers that cannot disagree

One stock figure per SKU. One ledger. One order record. Not a copy per channel that somebody reconciles on Saturday. When the website says four are left, four are left.

3

Built for how India actually runs

GST with input credit on accepted goods, TDS and TCS, seven marketplaces, piece-rate karigar wages — and apps that keep working when the internet does not.

WHAT CHANGES FOR YOU

The same day, before and after

Nothing here is a new way to run your business. It is the work you already do, arranged so that it only has to be done once.

TODAY

- ✗ Log into seven seller panels, one at a time
- ✗ Copy each order into a sheet, then into the books
- ✗ Guess which stock figure is the real one
- ✗ Learn at month-end that a mill over-billed you
- ✗ Chase a marketplace shortfall you spotted six weeks late
- ✗ Ask three people for their file before you can see one number

WITH VASTRANGAM BOS

- ✓ One queue, sorted by whichever order is closest to being late
- ✓ The order writes itself into stock and into the ledger
- ✓ There is one stock figure, so there is nothing to choose between
- ✓ An over-billed invoice cannot be paid — the match refuses it
- ✓ Every shortfall is on a screen the day the payout lands
- ✓ Open the dashboard. It was already up to date.

Vastrangam BOS at a glance

What it is	A unified ERP: 21 modules and 113 apps sharing one data core and one event bus.
Shared data core	Item/SKU · Party · Stock · Ledger & Voucher · Order — every module reads and writes these.
Key difference	Not a suite of integrated apps. One application, so there is no sync step and no duplicate master data.
Compliance	Double-entry accounting with CGST/SGST/IGST, TDS, TCS, ITC on accepted goods, GSTR-1 and GSTR-3B.
Channels	Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa, JioMart, plus Shopify and WooCommerce.
Security	PostgreSQL row-level security per company; integrations use revocable scoped API keys in an AES-256-GCM vault — never account passwords.
Deployment	Hosted multi-tenant cloud, or single-file offline apps that run by double-clicking with no install.

THE PROBLEM

Your business runs on eleven tools that don't talk

Accounting in one place, stock in a spreadsheet, marketplace orders in seven seller panels, karigar wages in a notebook. Every month-end becomes an archaeology project.

Numbers that disagree

Stock says 40, the marketplace says 12, the books say something else again. Nobody knows which is right, so everyone guesses.

Work entered three times

The same invoice keyed into the seller panel, the spreadsheet and the accounting package. Three chances to be wrong.

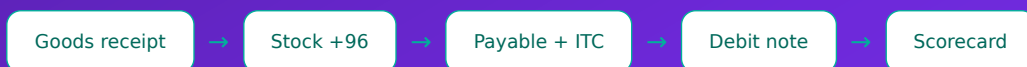

Money quietly leaking

Over-billed purchases, unclaimed marketplace shortfalls, RTO losses — invisible until the year is over.

HOW IT WORKS

One data core. One action cascades everywhere.

Every module reads and writes the same five entities. That is the physical reason a single goods receipt can touch stock, books, quality and sourcing at the same instant.

UNIFIED DATA CORE

Item / SKU

Party

Stock

Ledger

Order

→ Inventory · stock in

→ Finance · payable & ITC

→ Quality · debit note

→ Sourcing · risk updated

← Planning · requirements

← Marketplace · order pull

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems increase stock by 100 and claim tax credit on 100. Vastrangam BOS increases stock by **96**, claims input tax credit on **96**, raises a debit note for the 4 rejected, and lowers that mill's accept rate — automatically.

Nothing derived is ever stored

Outstanding, risk, performance, ageing, profit per product — all recomputed on read. They cannot drift out of step with the documents underneath them.

WHERE THE BUILD STANDS

16 apps working today, 2 more with their engine running. 95 still to build.

Nothing on this page is called finished unless it is. Every app further down carries a badge saying which it is, and the counts here are counted from the module list each time this page is built — never typed in.

The honest count

Modules	21 business modules, plus the Platform spine underneath them — 22 numbered in build order
Apps	113
Working today	16 — each carries its own self-tests and is checked in a real browser, in both editions
Engine working, screen to come	2 — the hard part is written and passing its own tests on the command line, but there is no screen yet, so they are not counted above
Still to build	95 — designed and specified, not yet written
Build order	Dependency order: a module is started only once everything it needs already exists
Companies	Vastrangam (invoices VS) · Ethnic Fashion trading as Go4Fashion (invoices EF, SKUs EF) · Adini Couture (invoices AC)

THE ONE IDEA

Every module reads and writes the same six records.

That is the physical reason a single goods receipt can touch stock, the books, quality and sourcing in the same instant — not a promise about integration, a consequence of the design.

One stock number, not one per channel

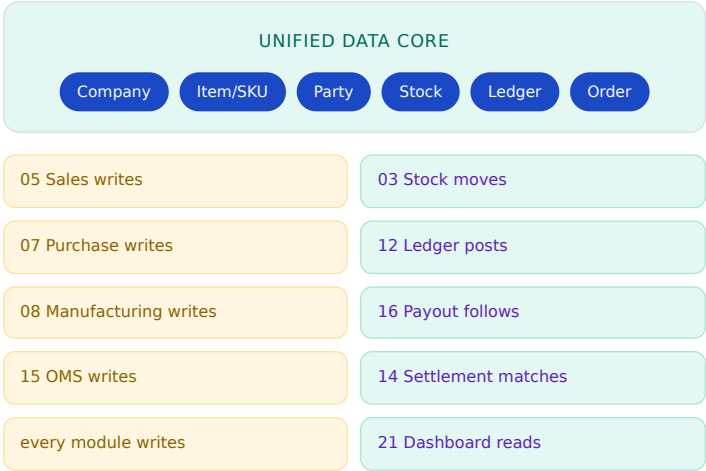

The last piece sold at the Surat counter disappears from Myntra and Flipkart in the same instant — not three hours later as a cancellation, because cancellations are what a seller rating is lost to.

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. This one raises stock by 96, claims input credit on 96, raises a debit note for the 4 rejected, and lowers that mill's accept rate — automatically.

Nothing derived is ever stored

Outstanding, ageing, risk, promise dates, cost per piece and profit per design are recomputed on read. A stored total can drift away from the documents underneath it; a computed one cannot.

Three companies and seven marketplaces is your data — not a ceiling.

A company is a row. A channel — a marketplace account, the D2C site, the counter, the B2B desk, an export buyer — is also a row.

Every record carries the company it belongs to and every sale carries the channel it came through, so ten companies selling on ten channels each is the same tables and the same code as three and seven.

What is fixed, and what is not

Companies	A row each. The software sets no limit of its own.
Channels	A row each. The eleventh marketplace is a row, not a release.
Stock	One number per SKU. Never one per channel.
The group figure	The sum minus inter-company trade, with the elimination shown.

Each company's books are its own

Its trial balance balances on its own, and no journal line can point at an account belonging to a different company. That is checked by a test, not left to discipline.

The group is the sum minus what you sold yourselves

A sister company buying from a sister company is revenue in one set of books and cost in another. Adding the companies up would report turnover the group never earned from the outside world, so every entry naming a sister company is eliminated — and all three figures are returned, so you can see the elimination rather than trust it.

The channel is a dimension of the sale, never of the stock

Read any month by channel, by company, or by both. What you cannot keep is a separate stock number per channel — the last piece sold on one marketplace has to vanish from the other ten in that instant, which per-channel inventory cannot do.

Checked, not claimed. The core test posts across a 10×10 grid — a hundred channels — and asserts every company's books balance, that no line reaches into another company, and that the group is ₹2,10,500 gross minus ₹50,000 inter-company = ₹1,60,500. It then runs 11×11 with nothing in the code changed. In the working Dashboard & BI app you can add the fourth company and the eleventh channel yourself and watch every figure hold.

THE PROOF

One garment. Eight modules. One database.

The test of whether this is one system or 113 programs sharing a login: sell a single garment and follow it. Every step below is the same record, moving — nothing is re-keyed between them.

15 · Order lands in one queue

03 · Stock down on every channel

10 · Picked from the named bin, filmed

11 · Courier booked, COD banked

12 · Revenue and GST posted

14 · Payout matched to the paise

HOW IT WORKS, IN USE

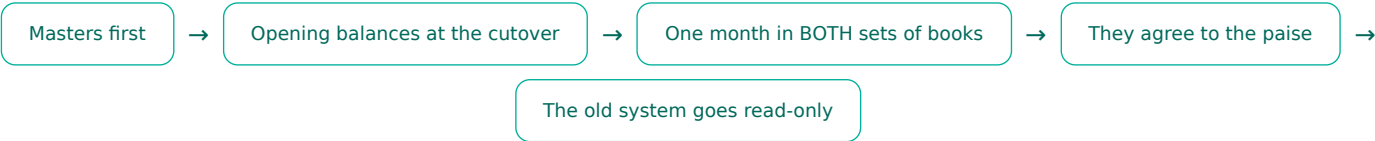

A walkthrough

Everything above says what the system is. This follows a design through it, because "22 modules over one shared data core" is a true sentence that tells you nothing about your Tuesday.

Every screen below is a real render of the software, not an artist's impression — the same markup and the same stylesheet the product uses. The figures on them are illustrative.

Where you are starting from

You are not starting empty, and that is the whole difference. There is a working house here: three companies, nine panels, a counter, an export book and people who are paid by the piece. So the first month is a parallel run, not a switch that gets thrown.

The gate is that the two agree to the paise, and where they do not, the reason is named rather than the number quietly adjusted. A cutover that cannot reproduce last month is not a cutover.

A day in the life — one design, followed to the money

It sells on a panel

MODULE 15 · E-COMMERCE / OMS

Nine panels land in one queue. It is sorted by the time left on the cut-off, not by when it arrived — so the Myntra order that has to leave in forty minutes sits above the one that came in this morning and has all day.

Panel queue · 9 channels · cut-off running

44

It is picked in the godown

MODULE 10 · WAREHOUSE

A wave in walking order, zone A to C, confirmed against the bin it came from.
A short pick stops the pack rather than quietly shipping the order light.

It goes to the courier

MODULE 11 · LOGISTICS

The rate is checked against the packed weight before booking — which is where weight disputes are won — and COD collected at the door stays a receivable until it is actually in the bank.

The books post themselves

MODULE 12 · ACCOUNTING & GST

Revenue and GST through one posting engine. Entries balance or they do not post. There is no third option and no month-end hunt for the one that did not.

Weeks later, the panel pays

MODULE 14 · SETTLEMENT

What the panel said it would pay against what actually arrived, cycle by cycle.
A shortfall is named and claimed inside the window, instead of being noticed a quarter later when it can no longer be claimed.

Payment Data Scope

Identity, Settings & Audit

to build

Users, roles and permissions, company switching, tax and numbering setup — and an immutable record of everything that ever happened.

Ask & Print

WORKING TODAY

At an exhibition in Hyderabad, send one line from your phone: “ledger Kalamandir”, “print slips”. It comes back as a PDF, or it prints at the Surat office — with nothing plugged into your phone and nothing at the office open to the internet.

WhatsApp Command Console

to build

The shop floor does not open a laptop. A karigar or a staff member sends a short message — in, out, today’s pieces, leave, an advance — and it becomes a real record: attendance with the time and place it was marked, a production report against the design, a request in the approvals queue. The end-of-day prompt asks what is still open and how long it needs, so tomorrow starts from what is actually pending rather than from memory. Marking attendance checks the phone is at the unit within the radius set for it, with a grace window; a person outside it is not refused, they are flagged for the manager, because a system that locks someone out of being paid for being early at the wrong gate has failed at its job. Every override is recorded with who made it. The words a worker types are in the language they speak, and nothing here ever asks for a password, a bank detail or a document number.

Provider Router & Cost Guard

ENGINE WORKING · SCREEN TO COME

The rule that no capability depends on one outside service, enforced at the moment it matters instead of merely promised. Every capability has an ordered fallback list ending on an option that needs nothing connected, so a courier API that stops answering at 9pm, or an AI key that hits its quota mid-catalogue, drops to the next option instead of stopping the work. A provider that keeps failing is tripped out of the list entirely and retried once after a cooldown rather than hammered; retries inside one provider wait twice as long each time. And every paid call is counted in paise against a ceiling you set — over the ceiling the paid provider is refused, not warned about, and the work completes on a free one. Because every capability is guaranteed a built-in or by-hand option, a spent budget can stop the spending without ever stopping the business.

Industry Packs

to build

What your trade calls things, the stages your work moves through, the extra fields your records need, the documents you issue and the reference data you start with — all of it loaded as a row of configuration, never as a separate version of the software. Pick the pack that matches your trade and the whole system changes its words: the same order screen reads as a job, a matter, a consignment or an appointment, with the same columns underneath. A pack may rename what exists, add fields to tables that exist, and switch discretionary rules off; it may never invent a concept, add a field to a table that does not exist, contain any executable code, or switch off the guarantees — company scoping, the audit trail, money never being a float — because a trade may change its vocabulary and may not opt out of the things the books are trusted for. Adding a trade nobody anticipated is therefore a file somebody writes, not a release somebody ships.

Communications

to build

WhatsApp commands and broadcasts, email and SMS, and the handful of scheduled jobs that carry a nudge to the right person without anyone remembering to send it. Every capability here has more than one interchangeable provider — none of them is ever the source of a figure the business reports.

Data Privacy & Consent

to build

What a person’s data may be used for, captured as consent at the point it is given and honoured everywhere downstream — including the right to have it corrected or removed. Retention (how long a record is kept) and deletion (a person’s right to have their own data removed) are two different policies, tracked separately, because a rule that keeps records for the law and a request from a person to be forgotten do not resolve the same way.

Payment Data Scope

to build

A written statement of exactly which systems ever see a card or bank credential, and which never do — because every card-capable screen in this system hands that moment to a payment provider’s own secured field and never stores or even passes the number through application code. The statement is what an auditor or a partner asks for before they will connect to this system.

Design & Sampling

MODULE 02

2 APPS

A style exists on paper before it exists as stock

A product moves from a first idea to something the business can actually make and sell — specification, sample rounds, costed trials and sign-off — before it is ever entered as a catalog record. Building this first means Inventory & Catalog never has to invent a style it has no real specification for.

PLM & Development

Design / IP Register

PLM & Development

to build

Concept to a design that can actually be made: fabric and trim specification, sample rounds with the mill, costed trials against a target price, and sign-off — every version kept, so last season’s costing is still there.

Design / IP Register

to build

What protects a design once it exists — trademark or copyright status, the date it was first shown, and a flag the moment a near-identical listing turns up elsewhere. Every version already kept by PLM & Development gets a filed status here instead of just a date stamp, because a design with no ownership record on file is a design nobody can defend.

Inventory & Catalog

MODULE 03

4 APPS

One stock number everyone trusts

The most important number in the house: one quantity per design and size, per godown, per stage — greige, dyed, in stitching, finished, listed. Read and written by every other module. And one product record every marketplace lists from.

- Kit & Combo SKU
- Master-Data Hygiene

Stock

to build

Live quantity by design, size and location, fabric in metres and pieces in numbers, with reorder alerts, lot tracking, set kits and dead-stock ageing.

Catalog / PIM

to build

One record per design — fabric, work, length, colour, size chart, images, HSN, MRP and what each panel actually sells it at — scored for Myntra and Amazon readiness before it lists. It also carries the two things everything downstream needs: the code each panel knows the design by, mapped to yours, and the packed size and weight that decide the courier rate and settle every weight dispute. Every listing’s state on every panel is here too — live, waiting for approval, blocked, archived — with the quality score that decides whether anyone sees it.

Kit & Combo SKU

to build

A sellable SKU made of component SKUs — a three-piece set sold as one listing. Selling the kit decrements each component at order time, so stock is right for every piece in the set, not just the set itself.

Master-Data Hygiene

to build

Duplicate detection and merge across customers, vendors and designs, and a dead-stock register for what has not moved in months. Protects every downstream report from the same record existing twice under two names.

CRM

MODULE 04

4 APPS

Know every boutique, chain and customer completely

One record per party — a Kalamandir or a Rajmandir, a Surat walk-in or a Myntra buyer — carrying every enquiry, order, return, agreement and conversation, whichever channel it arrived on.

CRM & Customer 360 WORKING TODAY

Enquiry to confirmed order, then the full lifetime: what they bought, what came back, what they are worth and which new range to show them first.

Helpdesk & Live Chat WORKING TODAY

A boutique asking where its parcel is, or a customer asking about a size — the question becomes a ticket tied to the order, with the whole history already open.

Documents & eSign WORKING TODAY

Mill agreements, job-work contracts, signed delivery challans, export documents and boutique credit terms filed against the party or order they belong to — found by that record, not by hunting through a folder.

Forms & Feedback (NPS) to build

A short form after delivery, and the score it produces attached to the design or item it is actually about — not just the buyer — so a complaint-prone item surfaces as a pattern instead of a scatter of individual gripes.

Sales

MODULE 05

8 APPS

Counter, wholesale, website and export — one order book

The Surat counter, the boutique wholesale book, the website and the export shipment all write to the same order and draw on the same stock number. And the parcel is followed to the door, because a sale is not done until the COD money is in.

Customisation & Made-to-Measure

D2C Sales WORKING TODAY

Orders from your own storefront, cart to dispatch, with loyalty and partial COD on a ₹4,400 anarkali.

Export WORKING TODAY

Commercial invoice, packing list, LUT bond and IGST-refund tracking for the Gulf and UK buyers.

Quotes & Proforma WORKING TODAY

Send a quote, convert it to a confirmed order in one click.

Subscriptions to build

A schedule that raises its own invoice on its cycle and follows up on its own when a payment fails — for anything sold as a standing order rather than a one-off.

B2B & Credit WORKING TODAY

Boutique and chain orders on credit limits and tier pricing, with outstanding aged against each party's own agreed terms.

POS WORKING TODAY

Counter billing at Udhna that draws on the same stock as the website — no second stock register.

Couriers & AWB to build

Book the parcel on the order, compare couriers for that pin code, print the label with the design code on it, and follow the AWB to the door.

Customisation & Made-to-Measure to build

The order that does not exist in the catalogue: a buyer sends reference pictures and their own measurements, a price is agreed over several messages, and the piece is made for them. All of it is one record — the references, the measurement set, every quote in the negotiation and what was finally agreed, the advance taken to start work and the balance taken before dispatch. When the order is accepted it opens a production order like any other, so a bespoke piece is costed, stitched, checked and posted exactly as a catalogue piece is. Two legs of money on one order is the part most systems get wrong: the advance is earned when the work starts, the balance is owed until the piece ships, and the ledger shows both separately rather than one payment appearing when the whole thing is over.

Planning & Requirements (MRP)

MODULE 06

3 APPS

Turn what is selling into what to buy and make

Confirmed orders and demand history have to become a plan before Purchase can buy anything or Manufacturing can start anything — otherwise buying and making are both just guessing. This module sits between the two: it reads what is actually selling and what is already committed, and turns that into requirement, not the other way around.

Demand Forecast & Signal

to build

What sold, by SKU and by period, turned into a short-term forecast — the number every requisition and every production order downstream is measured against instead of a guess.

Open-to-Buy / Budget Ceiling

to build

A spending ceiling set per period regardless of what the demand signal suggests, so a real signal cannot on its own commit more money than the business has decided to risk this season. Every requisition the MRP run drafts is checked against what is left of the ceiling before it goes to Purchase.

Requirement run · what to buy for the festive book

Material ordered twice

0%

Requirement Explosion (MRP run)

to build

Confirmed demand exploded through the bill of materials into what raw material to buy and what to produce, and by when — so a purchase requisition or a production order always traces back to real demand, never to a feeling that stock is getting low.

Purchase

MODULE 07

3 APPS

Nothing over-billed by a mill gets paid

The buy side end to end — mills, dyers, job workers and packing suppliers — with the control that stops you paying for metres you rejected.

Vouchers posted automatically

81%

Invoicing

to build

GST tax invoices and receipts, worked out from the lines to the paise. Where a panel raises its own invoice you keep both numbers on the order — theirs and your own series — so the panel’s paperwork and your books point at the same sale.

GST & Tax

to build

CGST, SGST, IGST, TDS, TCS, input credit, GSTR-1 and GSTR-3B — filed per registration, so a group where one company is registered and another is not files exactly what each one owes and nothing it does not.

Receivables, Payables & PDC

to build

Payments and receipts allocated against named open invoices, and a register for post-dated cheques that posts only on the date they are realised, not the date they were written.

Year-End Close & Period Lock

to build

Profit-and-loss accounts reset and balance-sheet accounts carry forward at year end, and a reviewed period locks against backdated edits until an admin unlocks it — an act that is itself logged.

Know what cash is coming, not just what already arrived

Accounting records what happened; this module is concerned with what happens next — how much cash is actually expected, when, and whether spend against a budget is on track before the month closes and turns the answer into history.

AR / Virtual Try-On

Marketplace OMS

WORKING TODAY

Myntra, Flipkart, Ajio, Amazon, Meesho, Nykaa and JioMart in a single queue — processed all together, channel-wise, or design-wise. The stages the panels really use, with the right cut-off counting down on each order — a quick-commerce or air-shipped order is not due at the same hour as a standard one. Priority orders at the top, and the day grouped by design so a Muskan Purple is picked once for eleven parcels instead of eleven times.

Manual Data Check

to build

The order and return sheets you already download from the panels, and the offline registers from the three shops — one file or a whole ZIP — read back as ten cross-checks: net sale after commission and fees, month, design, state, wrong returns, SPF claims, ads, payouts and GST. Every figure clicks through to the transactions behind it.

Claims & Disputes

to build

Weight disputes, SPF shortfalls, parcels lost in transit and returns that came back with a different piece inside — filed as claims with the packing footage attached, and answered before they close. A claim awaiting your reply is money; one closed for no response is nothing, so the days left sit beside the amount.

Channels & Storefronts

to build

Connect a channel once and it stays in step: catalogue out, price out, stock out, orders in. Seven marketplaces and any website platform — Shopify, WooCommerce, Magento, BigCommerce, Wix or a custom site over its own API — each switchable without touching your data. Shopsy and any other storefront a channel runs alongside its main one counts as its own channel here. Where a channel has no open interface, its own downloaded report is a first-class way in. A channel may also know you by a different trading name — that is a label on the channel, not a second company, so it tags the order and the payout without ever splitting your books.

Listing & Catalog Manager

to build

Bulk-create and bulk-edit listings across every channel from the one product record in Inventory & Catalog, and catch the mismatches that quietly cost sales: listed but out of stock, or in stock but never listed.

AR / Virtual Try-On

to build

A way to see drape, fit and colour on a screen before buying, for items where a flat photo alone leaves too much to guess.

Order Management

WORKING TODAY

One pipeline from new to delivered, whether the order came from a seller panel, your Shopify or WooCommerce site, a dealer or the counter.

Reconciliation

to build

Match every marketplace payout to the order line that earned it, and expose the gap.

Returns / RMA

to build

Customer returns, courier returns and wrong returns kept apart — because only one of the three is really your fault, and only one of them turns into dead stock.

Labels & Documents

to build

The panel gives you a PDF; this hands the packing table something it can work from. Cropped to 4×6 for every channel, your design code printed large where the panel left it off, the invoice and slip merged behind it, and the whole batch to the label printer in one job. Reprint one parcel without redoing the lot — and no customer's name and address is ever uploaded to an outside website to be cropped.

Size / Fit Recommendation AI

to build

A fit suggestion at the point of purchase, built from the item's own measurements and the return history of buyers who picked each size — aimed straight at the return reason that costs the most: the right item in the wrong size.

PANEL	TO ACCEPT	TO PACK	RTD	CUT-OFF

- Recruitment
- Payout Execution

Staff & Contractors

to build

Attendance marked by tap, effective-dated salary, and karigar piece-rate earnings in a single register.

Time-off & Advances

to build

Leave, Diwali advances, and exactly how they change this month's payout before you approve it.

Appraisal & Hiring

to build

Performance reviews and a hiring pipeline that ends in an employee record.

Recruitment

to build

The pipeline before someone becomes an employee — an opening, the people who applied for it, a trial piece where the work itself is the interview, and the decision with its reason kept. It matters more here than in most trades: a karigar is taken on for skill on a particular garment, and the trial output is the evidence, so it is recorded against the design and the rate that would apply rather than remembered as an impression. A candidate who is not taken on now stays findable when the same skill is needed in a busy month, and their personal documents are held under the same consent and retention rules as anyone else's, not in a folder on somebody's phone.

Payout Execution

to build

Where the calculation in the earnings register actually turns into money leaving the business — bank batch, UPI, cash against a signed receipt — with the method and the reference recorded against every payout, so the register's total and the money that actually moved can always be checked against each other.

Marketing

MODULE 17

- Blog & Pages
- Events
- Website & Page Builder

Markdown / Clearance Optimization

Social Calendar

to build

Plan and publish across every channel from one calendar.

Campaigns

to build

Email, SMS and WhatsApp campaigns measured on real revenue, not opens.

Repricing Engine

to build

Rules per panel and per design — floor, ceiling, match-lowest and a festive override — so a Diwali sale does not quietly go below cost. And what each change actually did: a design whose orders fell after a price rise shows as exactly that, next to the rule that raised it.

Automation

to build

If this happens, do that — across any module, without writing code.

Blog & Pages

to build

How to drape it, what to wear it to, which fabric for which season — written, scheduled and published to your own site with the meta and internal links already set.

Events

to build

Trade shows and exhibitions worked as a channel of their own — booth, budget and every lead captured on the floor landing straight in CRM instead of on a stack of business cards.

Website & Page Builder

to build

The storefront itself, built by dragging sections into place rather than by editing a theme file — hero, product grid, size guide, lookbook, contact form — each block reading live from the catalogue, so a price or a stock state on a landing page is the same number the order screen uses instead of a figure someone pasted in and forgot. Blog & Pages above writes articles into a site that already exists; this is for the businesses that do not have one, and it is the gap that shows up plainly when this module list is set beside a mature open-source ERP: they ship a full site builder next to the blog, and until now this did not.

Markdown / Clearance Optimization

to build

The same rule engine that reprices for competitiveness, aimed at ageing stock instead: when to start discounting it and by how much, before it becomes a warehouse write-off rather than a sale at a lower margin.

AI Content Engine

MODULE 18

8 APPS

Write it, shoot it, cut it — from your own catalogue

Listings, ads, reels and product photography generated from your own designs, in a voice that sounds like one person from Surat rather than a template — so the words match the piece and the picture is the size Myntra actually wants.

Image Generation Slot

Publisher

Content Engine

to build

Fourteen stages in your own voice — buyer psychology, competitor reading, hooks, the product description, marketplace copy for Amazon and Myntra, ad variations, reel scripts, song lyrics for the reel, the calendar, size chart and alt text.

Video Studio

to build

Text and image to video, reels and ad cuts sized for every channel.

Motion Renderer

ENGINE WORKING · SCREEN TO COME

A reel rendered from a page of HTML and CSS — the same layers, fonts and brand colours the Design Studio already uses — into a real MP4, on this machine, with nothing uploaded. It is not a screen recording: the clock is faked, the animation is seeked to the exact instant of each frame, and only then is that frame captured, so the render does not care whether the machine was busy. Rendering the same festival banner twice produces the same file to the byte, which is what makes a reel something you can check and re-cut rather than something you have to watch all the way through and hope about.

Image Generation Slot

to build

Generated imagery — a model on a background you do not have to shoot, a festival backdrop, a lifestyle scene — as a capability with interchangeable providers rather than a bet on one service: a queue of jobs, a preview while it works, inpainting to fix one region, upscaling and face correction. This one needs a graphics card. Image models cannot run on an ordinary office machine or on the container this system is built in, so what ships is the queue, the review screen and the provider slot, with the generating itself done by whichever engine you point it at — your own GPU box, or a cloud service, swapped without touching anything else. Said plainly here because the alternative is a screen that looks finished and produces nothing.

Image Studio

to build

A phone photo becomes a listing image: layers, free transform, background removal, Myntra 1080×1440 and every other channel preset, watermark and SEO alt text.

Design Studio

to build

Banners, festive creatives and thumbnails — templates, layers, undo and redo, any colour, exact sizing and stock elements, exporting PNG, JPG or PDF at whatever size the panel or the printer asks for.

Narration Studio

to build

A voice over the reel, in the language the buyer actually speaks — the same script the Content Engine wrote, spoken. The default needs nothing installed and no key, because every modern browser can already speak; a self-hosted or cloud voice sits behind it as an interchangeable provider for anyone who wants a cloned or branded one. Long scripts are split at sentence boundaries and rejoined, so a two-minute description is not cut off at whatever limit a service imposes. A voice cloned from a real person is only ever used with that person's recorded consent, filed against them in Data Privacy & Consent like any other permission.

Publisher

to build

One push sends the listing, images and copy to the website and every panel, and reports back what went live and what a panel rejected, with the reason.

Be found by a search box, an answer box and an AI

Content already exists once this module is reached; here it is made findable — by a traditional search engine, by the answer box above the results, and by the AI assistants now answering shopping questions directly instead of sending someone to a results page.

MODULE 20

7 APPS

The work that is not an order — and the talking around it

An exhibition in Hyderabad, a boutique's custom order, a new godown fit-out, a legal matter with a supplier. Work that is not a sales order still has a deadline, a cost and documents — and it belongs on the same records as everything else.

Knowledge Base

Projects & Cases

to build

An exhibition, a custom order for a chain, a fit-out or a dispute — stages you define, owners, deadlines, documents, hours and real cost, all on one record the ledger can see.

Approvals

to build

One queue for everything waiting on a yes: a mill purchase order, a boutique discount, a leave day, a credit note, a payment. The rule that sent it there is next to it, and the decision goes on the record.

Timesheets & Planning

to build

Who is on what this week and the hours that actually went in — against a project, an exhibition or a machine — with billable and non-billable kept apart.

Forum

to build

Questions and answers that outlive a chat — for customers, dealers or staff — with the useful ones kept where the next person will actually find them.

**Automation Studio** to build

The place a person builds “when this happens, do that” by dragging it out and watching it run — a trigger, the steps after it, a branch where the answer decides which way to go — over the same event stream every module already writes to. Marketing’s Automation aims that idea at campaigns; this is the general one, reaching any module: a payment marked short holds the next dispatch and opens a claim, a karigar’s pooled sets crossing a threshold raises the payout for approval, a return marked damaged writes off the piece and messages the buyer. Every run is kept — what fired it, each step, what each step returned — because an automation nobody can inspect afterwards is a rule the business cannot trust with its money.

**Discuss** to build

The conversation attached to the record it is about — this order, this mill bill, this dispute — so a year later the reason for the decision is still sitting beside it.

**Knowledge Base** to build

A searchable internal wiki of standard operating procedures, scoped to the role it applies to, so how a task is meant to be done is written down once instead of carried in one person’s head.

 Dashboard & BI MODULE 21 5 APPS

See the whole house without asking anyone

Every number rolls up here as work happens — the day’s marketplace orders, what the karigars finished, what is still lying at the dyer, what the mills are owed. No exports, no waiting for month-end.

WRITES TO

—

-  CEO Dashboard
-  Report Builder
-  Group Consolidation
-  Excel Dashboard Builder
-  ESG / Sustainability Reporting

**CEO Dashboard** WORKING TODAY

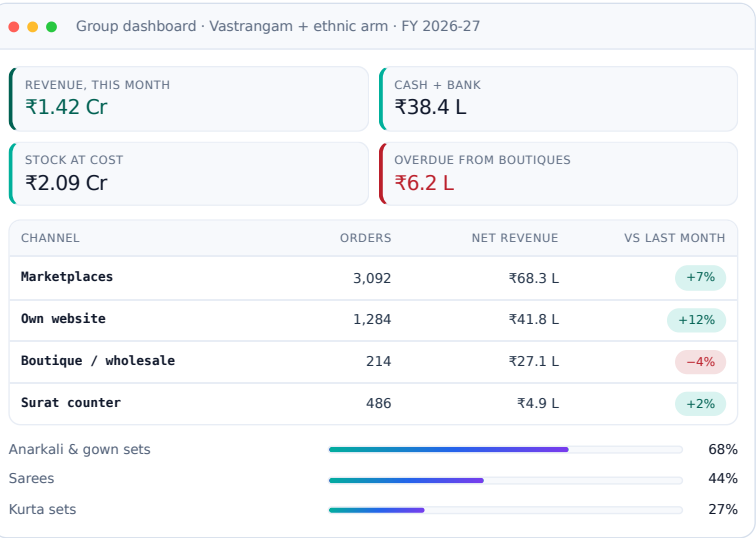

Cash, sales by channel, stock by design, profit per piece and the alerts that matter — one screen, refreshed as the day runs.

**Group Consolidation** WORKING TODAY

Ethnic Fashion, Vastrangam and Adini Couture as one set of figures, inter-company transfers removed, so the group position is real rather than three spreadsheets added together. Adini Couture has no registration of its own and mainly does job work — it still counts in the group, without being pulled into a return it does not belong in. Add the fourth company the day you open it.

**ESG / Sustainability Reporting** to build

Water usage, chemical compliance, waste and packaging, reported from the same certificate and audit records Quality & Compliance already keeps — so a sustainability report is a query over evidence already on file, not a separate exercise assembled once a year from scratch.

**Report Builder** WORKING TODAY

Drag the fields you want into a report and save it for the whole team.

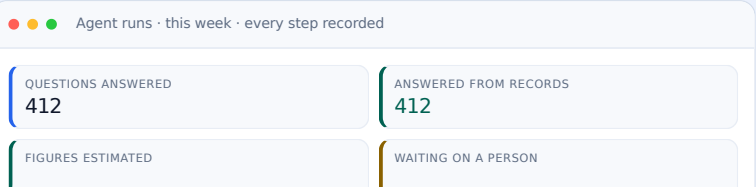

**Excel Dashboard Builder** to build

A full workbook — financial summary, HR, purchase, sales, inventory and production, GST, expenses — generated from the live records behind every other screen, with each company shown as its own row and a consolidated row that is a formula over them, never a separately typed total.

 AI Assistant, Agents & Automation MODULE 22 5 APPS

Ask the house a question — and let the routine work run itself

Last for the same reason Dashboard & BI is late: something that answers questions about the whole business can only be built once the whole business

is in one place. Three different things live here and the difference between them matters. An ASSISTANT answers a question you asked, from the records, with the records attached. A CHATBOT holds the same conversation with your customer instead of you. An AGENT is given a job rather than a question and works out the steps itself. That last one is what separates this module from Automation Studio in Module 20, where a person draws the steps in advance and the rule runs the same way every time; and from Automation in Module 17, which fires marketing campaigns and nothing else. Both of those stay exactly as they are — this module sits above them and calls them, rather than replacing either. Module 18 writes content; this module answers and acts.

AI Assistant

AI Chatbot

AI Agents

Agent Guardrails & Run Log

Knowledge & Retrieval

AI Assistant

to build

Ask in your own words — “what did Myntra actually pay us last week, and what is still short?”, “which designs did Kalamandir return most” — and get the answer with the rows it came from underneath it, each clicking through to the record. It reads the same ledger and the same settlement lines the accounts screen reads, so its figure and the books agree. When it cannot find the answer it says so; it never puts a plausible number in place of a real one.

AI Agents

to build

A job rather than a question: “chase every unmatched payout line from last week and draft the claim for each.” It works out the steps and stops where a person has to decide. Filing the claim, moving money, changing a price or messaging a boutique all wait for your yes.

Knowledge & Retrieval

to build

The index that makes the answers grounded: your own designs, rate cards, settlement files, standard procedures and past decisions, searchable so a reply quotes what is actually on file instead of what a model remembers about the trade in general. Permission-scoped at the row, so two people asking the same question get answers drawn only from what each of them may already see.

AI Chatbot

to build

The same engine facing your buyer, on the website and on WhatsApp: where is my order, will the L fit me, I want to return this saree. It reads the real order and the real size chart, not a script written last season, and it says “let me get someone” for anything about money or a complaint — handing over into the Surat helpdesk queue with the whole chat already attached. It never asks a buyer for a card number, a bank detail or a password.

Agent Guardrails & Run Log

to build

What each agent is allowed to touch, written down as a scope rather than trusted to a prompt, and every run recorded step by step: what started it, what it read, what it proposed, what a person approved, what it actually changed. Kept in the same audit trail as everything else, with the same absence of an off switch. An agent whose working nobody can inspect afterwards is not a colleague, it is an unexplained entry in the books.

HOW IT IS KEPT STRAIGHT

The rules, the checks, and what we will not claim.

Software that runs a business earns trust by being checkable, not by being described well. These are the standards this build is held to — written down, because a standard nobody wrote down is a standard nobody can be held to.

The rules that hold everywhere

Integrity

- ✓ No app depends on any single outside company — every capability has interchangeable providers and a by-hand option
- ✓ A provider named as the source of a figure is a bug; the ledger originates numbers
- ✓ The books are this system's own — no other accounting package is

What it refuses to do

Safety

- ✓ Never asks for a marketplace, bank or account password — scoped, revocable keys only
- ✓ Nothing is deleted, only deactivated — history must still resolve
- ✓ The audit trail has no off switch: 8 years, before-and-after values

How it is verified

Evidence

- ✓ The arithmetic runs with no screen involved, against seeded data
- ✓ Every screen and every control is clicked in a real browser — any console error fails the build
- ✓ Not "did the button click" but "did the thing happen"

What we will not claim

Honesty

- ✓ Nothing is called finished that is not — every app above is marked working today or to build
- ✓ Counts are counted from the source at build time, never typed by hand
- ✓ If a test fails, the failure is shown with its output

ever required

- ✓ Money is integer paise, never a floating-point number
- ✓ Salaries, prices, tax rates and commissions are effective-dated — March payroll uses March's salary

✓ Gates, not warnings — a COD order cannot be packed below its advance, a bill for more than was accepted cannot be paid

- ✓ It is not trained, it is built — no model learns from your data

✓ Against the owner's own figures — and where a source file has since changed shape, the gap is named, not hidden

- ✓ The shipped archive is re-tested after extraction, not just the working copy

✗ The 16 working apps still run on their own storage — rewiring them onto the shared core is the first job of Module 01

- ✗ 95 apps are designed and specified, not yet written; 2 more have a working engine but no screen on it yet

BUILT DEEP, NOT WIDE

The controls that pay for the software

Three-way match

A supplier bill only passes when the purchase order, the goods receipt and the invoice agree on price and quantity. Bills that over-charge or over-bill rejected goods are held automatically, with the reason in plain language.

Vendor risk that sees ahead

Risk blends weak performance, spend concentration and overdue bills. Your *best* supplier still flags medium risk when 44% of your buying sits with them — the fact worth knowing before a disruption, not after.

Settlement reconciliation

Import a marketplace settlement, match it to the orders, and see every commission, TCS deduction, weight discrepancy and short payment — with a claim pack ready to file.

Karigar piece-rate

Pooled set completion, per-garment rates, alteration hours and advances roll into each karigar's payout — and into a true cost per piece for every design.

One stock number

One quantity per SKU per location per stage, pushed to every channel. Overselling stops being a monthly apology.

AI studio built in

Listings, ad copy, product photography and reels generated against your own catalogue — not a bolted-on chatbot, but the same data core.

INDUSTRIES

Built on the neutral engine, dressed for this trade

Every screen you are about to read runs on one industry-neutral engine.

Only the master data and the words change — which is exactly why a machine shop or a law firm could run the same code.

What is different here

Fabric in metres and pieces in numbers on the same item master. Karigar piece-rate with pooled set completion. Design-wise costing to the paise. HSN 5007 / 5208. Wrong-return dead stock treated as the loss it is.

The channels you actually sell on

Myntra, Flipkart, Ajio, Amazon, Meesho, Nykaa and JioMart in one queue, plus the Surat counter, the boutique wholesale book and export to the Gulf — all writing to the same order table.

The people who make it

Cutting, stitching, embroidery, finishing and checking as stages you set. Karigars paid by the piece, staff paid by the month, both in one register and one payout.

The compliance you file

GST on ethnic wear slabs, TCS the marketplaces deduct, TDS on job work, LUT bond and IGST refund on export — all worked out from the same vouchers.

COMPARISON

Vastrangam BOS vs. a suite of integrated apps

The difference is architectural, not cosmetic.

CAPABILITY	VASTRANGAM BOS	TYPICAL SUITE
Architecture	One app, one data core	Many apps, integrated
Master data	Single Item & Party record	Duplicated per app, synced
Stock truth	One number per SKU × location	Per-app, reconciled nightly
Cross-module posting	Instant, via event bus	Scheduled sync jobs
Marketplace settlement	Reconciled to order line + claim pack	Usually a separate tool
Piece-rate manufacturing	Built in	Custom development
AI content & imaging	Native, on your catalogue	Third-party add-on
Offline capability	Single-file apps run offline	Cloud-only

TRUST & SECURITY

Your credentials are never the key

Scoped keys only

Marketplace, bank and courier connections use revocable, scoped API keys held in an AES-256-GCM vault. Vastrangam BOS never asks for, uses or stores an account password.

Isolation by row

Every record carries a company id and is enforced by PostgreSQL row-level security. Group companies stay separate but consolidate on demand.

Immutable audit

Every posting, price change and permission grant is written to an append-only trail with actor, timestamp and before/after values.

THE GAP

Three categories of software. Nobody sells all three.

You are not short of tools. You are short of one tool that covers all of it — which is why the numbers never agree.

Accounting & ERP suites

Tally · BUSY · Marg · Zoho · Odoo

- ✓ Books, GST, stock, purchase
- ✓ Manufacturing, payroll
- ✗ No marketplace order queue
- ✗ No settlement reconciliation or claims
- ✗ No content, image or video studio

Marketplace OMS platforms

Unicommerce · EliteSecom · SmartHub

- ✓ Panel orders in one queue
- ✓ Inventory sync, settlement
- ✗ No double-entry books, no GST return
- ✗ No manufacturing, purchase or payroll
- ✗ No content, image or video studio

AI content tools

Writing · image · video generators

- ✓ Copy, pictures, reels
- ✗ Knows nothing about your catalogue
- ✗ No orders, no stock, no books
- ✗ Nothing publishes to a channel
- ✗ Nothing reconciles afterwards

Vastrangam BOS

All three, over one data core

- ✓ Books, GST, stock, purchase, manufacturing, payroll
- ✓ Marketplace and storefront order queue
- ✓ Settlement, claims, returns, packing footage
- ✓ Content, image, design and video studio
- ✓ One record underneath all of it

In an accounting package you will never get a marketplace OMS. In an OMS you will never get your books. In a content tool you will never get either. That is the gap. Vastrangam BOS is built in it.

THE APPROACH

Built deep, not wide

A long feature list is easy. What is hard is the one control that stops the money leaking — so every module ships with one, and refuses rather than warns.

01

Accepted, not ordered

You order 100. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. Vastrangam BOS raises stock by 96, claims credit on 96, raises a debit note for the 4, and lowers that supplier's accept rate. Automatically.

02

The payout, to the order line

Not "the channel paid ₹49.1 lakh". Which order line was short, by how much, against which published commission rate — with the claim pack already assembled and the packing footage attached.

03

Nothing derived is stored

Outstanding, ageing, promise dates, payouts, on-time percentage and risk are recomputed every time you read them. A stored number goes stale the moment the document under it changes. These cannot.

PRICING

Start free. Pay when it runs your business.

The software puts no ceiling on how many companies you run — your plan does, and you move up when you need to. Two of the 21 modules — E-commerce / OMS and the AI Content Engine — are priced on what you actually use, because an order is work and a piece of content is work.

E-commerce / OMS & AI Content Engine

These two are metered, the way every serious order-management platform prices. You pay for orders that actually shipped and content that was actually produced — not for a seat that sat idle.

E-commerce / OMS

AI Content Engine

PER ORDER PROCESSED

ORDERS A MONTH	PER ORDER	INCLUDED
Up to 1,000	₹2.50	All channels, settlement, returns
1,001 – 10,000	₹1.80	+ claims desk, packing footage
10,001 – 50,000	₹1.40	+ multi-warehouse routing
Above 50,000	On request	+ dedicated throughput

An order is counted once, when it is dispatched. A cancelled or unshipped order is never billed.

PER PIECE PRODUCED

WHAT IS PRODUCED	COUNTS AS	RATE
Channel listing (title, bullets, description)	1 content	₹6
Social post, caption or ad variation	1 content	₹4
Product image · background, resize, preset	1 content	₹3
Reel or video cut, per finished clip	1 content	₹25

Bring your own model key and the rate drops to the platform fee alone — no lock-in, ever.

REQUEST A DEMO

Bring one month of your own data

Sales, purchases and stock for a single month. In forty minutes you will see what your current tools are hiding — the short payouts, the returns nobody costed, the stock that two systems disagree about.

- ✓ No obligation and no card details
- ✓ Your data stays yours — we work on a copy and delete it after
- ✓ You leave with the numbers, whether or not you buy

QUESTIONS

Frequently asked

What is Vastrangam BOS?

Vastrangam BOS is a unified ERP made of 21 modules and 113 apps that all read and write one shared data core — Item/SKU, Party, Stock, Ledger and Order. Because the data is shared, a single action such as a goods receipt updates stock, the ledger, quality records and the vendor scorecard at the same time.

How is Vastrangam BOS different from Zoho or Odoo?

Does Vastrangam BOS support Indian GST?

Which marketplaces does Vastrangam BOS connect to?

Can Vastrangam BOS be used outside textiles?

Is my data safe?

Can I use it without internet?

How long does implementation take?

Stop reconciling. Start running.

See your own numbers inside Vastrangam BOS. Bring one month of sales, purchases and stock — we will show you what your current tools are hiding.
