

UNIFIED ERP — ANY INDUSTRY

Module 02 · All three apps in one

The whole module over one set of records — add, edit, delete, upload, download

Module 02 · CRM — App 4 of 4

All three apps of Module 02 over one set of records — add, edit, delete, upload, and watch everything move.

- One file · opens by double-click
- Works offline — including the Excel upload
- Add · edit · delete · upload · download
- 49 / 49 self-tests pass

What this is, and what is inside

CRM, Documents and Helpdesk over one set of records, with all three sets of buttons on one screen, plus record editing and spreadsheet upload.

CRM & Customer 360, Documents & eSign and Helpdesk & Live Chat running on one shared set of records instead of three copies. Win a lead and the party appears on the customer list, with its documents and its tickets already hanging off it. File a document against an order and it shows up on that customer's record. Answer a ticket and the first-reply clock moves everywhere at once. Type records in, or upload an Excel or CSV of them, or export the lot back out. This is the app to test with: anything you can do here, the three separate apps do on the same engine.

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic and its own rules **49 different ways** every time it starts.

What this document covers

1. What this is, and what is inside
2. The spine of this module: one record
3. Why this app exists
4. Screen · Records
5. Screen · Upload and download
6. An upload, staged before anything is written
7. After it — one record, already carrying everything
8. Every figure, and where it comes from
9. Connectors — nothing is locked to one company
10. The three rules the app enforces on itself
11. What this app can be wired to
12. The 49 self-tests, in full (1 of 3)
13. The 49 self-tests, in full (2 of 3)
14. The 49 self-tests, in full (3 of 3)
15. How to run it, and what it will not do

The spine of this module: one record

The three apps in Module 02 are not three programs that talk to each other. They are **three views of one record** — the party.

What this app reads, and from where

COMES FROM	WHAT IT SUPPLIES
Sales	Orders and returns against the party record
Marketing	Which campaign a lead arrived from
Accounting & GST	Whether they paid, and how late
Projects & Collaboration	Projects and cases a document can be filed against
Platform	The reply and resolution targets, and who is on the desk

All four apps of this module are built from one engine file and one screen file. Not four codebases that agree — one implementation, compiled four times.

Why this app exists

The first three apps of this module are CRM & Customer 360, Documents & eSign and Helpdesk & Live Chat. This is all three of them over **one set of records**, with **all three sets of buttons on one screen** — plus the two things none of them has: you can change the records, and you can upload a spreadsheet of them.

ONE SET OF RECORDS

Parties · Leads · Orders · Documents · Tickets · Messages · Notes

← You: typed, edited or uploaded

→ CRM screens

→ Documents screens

→ Helpdesk screens

The separate CRM app deliberately cannot sign a document or answer a ticket — those are other apps' rules and other apps' responsibilities. Here they are all on one screen, and every refusal still applies exactly as it does in the app that owns it.

SYSTEM

Backup & Health

Records · Files

Upload and download

Bring your Excel or CSV in, or save everything back out. No account, no internet, no library — it is all in this file.

Bring data in

Choose an .xlsx or .csv file

Download a blank template

Column headings are matched to fields by name, in any order, ignoring case and spacing. Columns we do not recognise are left alone, not treated as an error — a real export always carries columns you do not want. Party columns accept either the code or the full name. A row naming a party that does not exist is rejected with that reason rather than quietly creating one, because a typo should not become a second customer.

Take data out

Download everything as Excel

Download this table as CSV

Download a JSON backup

One sheet per table, with the same headings the importer expects — so what comes out can go straight back in.

TABLE	ROWS	COLUMNS
Parties	8	Code · Name · Kind · City · Email · On the books since
Leads	18	Code · Person · Organisation · Came from · Value · Stage · Open / won / lost · Raised on · If lost, why · Became party
Orders	28	Order · Party · Date · Amount · Returned · Channel
Documents	12	Reference · Title · Kind of document · Filed against · Which record · Issued on · Expires on · State · Who signs it · Signed on · One-time code used
Tickets	8	Ticket · Party · About which order · Arrived by · Subject · Priority · Handled by · Opened at · Closed at
Ticket messages	16	Reference · Ticket · Customer or us · At · What was said
Conversation log	3	Reference · Party · Date · Call / visit / email · What happened

Two rules the importer will not bend

A document cannot be imported as "signed" with no one-time code against it. If a spreadsheet claims a signature that cannot be evidenced, the row is refused — importing is not a back door around the rule.

A ticket cannot be imported against somebody else's order. Same reason as on screen: it would put one customer's delivery on another customer's record.

The rules live in the engine, so the form and the importer enforce exactly the same ones, with the same sentence explaining why.

Bring an Excel or CSV in, take everything back out. No account, no internet, no library.

Start with "Download a blank template". One sheet per table, with exactly the headings the importer expects — so the fastest way to get your own data in is to paste it into a shape that is already right.

Headings are matched by name, in any order, ignoring case and spacing. Columns we do not recognise are left alone rather than treated as an error, because a real export always carries columns you do not want. A party column accepts either the code or the full name.

Two rules the importer will not bend

1 row(s) ready — check the list, then choose

A document cannot be imported as "signed" with no one-time code against it. If a spreadsheet claims a signature that cannot be evidenced, the row is refused — importing is not a back door around the rule.

A ticket cannot be imported against somebody else's order. Same reason as on screen: it would put one customer's delivery on another customer's record.

The rules live in the engine, so the form and the importer enforce exactly the same ones, with the same sentence explaining why.

Three rows: one accepted, two refused — each named, with its line number.

The importer holds exactly the rules the screens hold. A ticket against somebody else's order is refused here as well as on screen, and a document claiming to be "signed" with no one-time code is refused too. An import that could do what a form refuses would be a back door, and everybody would learn to use it.

Nothing is written until you choose: **add**, **replace those tables**, or **cancel**. Accepted plus rejected always equals what was in your file, and there is a self-test that says so.

WHAT HAPPENED

Called about the July order — asked for longer terms

Record it

A customer record after a deal was won, a document filed and signed, and a ticket answered.

Nothing was refreshed, synced or recalculated. There was only ever one set of records. The pipeline, the filing and the desk are three ways of looking at it.

Which is why this is the app to test with: **test here, and you have tested all three.**

Every figure, and where it comes from

This is the same table as the app's Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Everything you type or upload	This app	Records are written once, in one place, and every screen reads them from there
Pipeline and Customer 360	CRM + Sales	The CRM screens, on the records in this app
Documents	Documents	The Documents & eSign screens, filing against the same party and order records
Tickets	Helpdesk	The Helpdesk screens, about the same parties and the same orders
One timeline per party	CRM + Documents + Helpdesk + Sales	Orders, documents, tickets, notes and the original lead, in one list, newest first
Upload Excel or CSV	This app	Column headings are matched to fields, every row is checked, and anything rejected is shown with its reason
Download Excel or CSV	This app	Every table written back out as a sheet, ready to hand to anybody

The rules of the whole module, in one place

RULE	WHAT IT MEANS IN PRACTICE
One party, never two	Winning a deal for an organisation already on the books attaches to that record. Two records for one customer means two answers to "what are they worth".
A document belongs to a record	Not to a folder. Filing against a record that does not exist is refused, because the document could never be found from the only place anybody looks.
A signature is a one-time code	Six digits, to the named signer, back from them, recorded against the document. No code, no signature — including on import.
The first-reply clock is derived	The gap between the ticket opening and our first message. There is no field to type it into.
A ticket cannot be closed unanswered	Ignoring somebody and marking it "resolved" is refused.
A ticket names its own party's order	Attaching anybody else's is refused, on screen and on import.
Behaviour groups are rules	Order count and days since the last order. Nobody tags anybody by hand, so nothing goes stale.

Connectors — nothing is locked to one company

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service**. Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

"Outside services required: 0" is not a marketing line — it is one of this app's self-tests.

The three rules the app enforces on itself

- 1

No capability has only one choice. Every one has at least three; most have eight to twelve.
- 2

Every capability has a built-in or by-hand option — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3

Every capability has an option you can host yourself — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

Module 02 · All three apps in one uses **7** capabilities and offers **61** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Books & ledger	Medhava Books · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext · CSV in / CSV out
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajo · Nykaa · JioMart · Shopify · WooCommerce · Medusa / self-hosted store
Automation	Medhava Rules · n8n (self-hosted) · Node-RED (self-hosted) · Windmill (self-hosted) · Apache Airflow · n8n Cloud · Make · Zapier · Pipedream · Cron + webhook · Do it by hand
Customer messaging	Copy the message and send it yourself · WhatsApp Cloud API · Gupshup · Interakt · MSG91 · Twilio · Email instead (any SMTP) · Chatwoot (self-hosted)
Email sending	Download the PDF and email it yourself · Any SMTP server · Amazon SES · SendGrid · Postmark · Mailgun · Zoho Mail · Brevo
Files & backups	This device · A USB drive · MinIO (self-hosted) · Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2
Printing	Browser print / PDF · Any ESC/POS thermal printer · Zebra label printer · TVS printer · No printer — share the PDF

Cloud services use a **scoped, revocable key** — **never your password**. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password**. If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 49 self-tests, in full (1 of 3)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	every button this app offers is really on one of its own screens
✓ pass	the pipeline, the documents and the desk all read the same parties
✓ pass	one party's timeline carries all three apps at once
✓ pass	winning a new organisation opens exactly one party
✓ pass	and takes that deal out of the open pipeline
✓ pass	and the new party is immediately on the customer list
✓ pass	and their timeline already carries the lead they came from
✓ pass	filing a document against a party puts it on their record
✓ pass	and on their timeline
✓ pass	it still cannot be signed without a code
✓ pass	it cannot be signed before it is sent
✓ pass	once sent, a six-digit code signs it
✓ pass	deleting it takes it off the record again
✓ pass	there is an unanswered ticket to work on
✓ pass	answering it drops the unanswered count
✓ pass	and gives that ticket a first-reply time worked out from the message
✓ pass	and it shows on that party's Customer 360 timeline

The 49 self-tests, in full (2 of 3)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	a row naming a party that does not exist is rejected
✓ pass	the rejection says to add the party first
✓ pass	a date that is not a date is rejected
✓ pass	a party can be given by its full name, not only its code
✓ pass	a row with no reference of its own is given one rather than refused
✓ pass	and the importer fills a blank reference in exactly the same way
✓ pass	but a reference somebody did type is kept exactly as typed
✓ pass	a good row is accepted
✓ pass	an import accepts the good rows
✓ pass	an import refuses a ticket against somebody else's order
✓ pass	an import refuses a ticket against a party that does not exist
✓ pass	every rejected row carries a line number and a reason
✓ pass	accepted plus rejected always equals what was in the file
✓ pass	every table exports as its own sheet
✓ pass	the first row of every sheet is its headings
✓ pass	what this app exports, this app can import again with nothing rejected
✓ pass	the figures survive the round trip

The 49 self-tests, in full (3 of 3)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	this app carries every screen of all three apps
✓ pass	its Customer 360 is the same function the CRM uses
✓ pass	its documents screen is the same function Documents & eSign uses
✓ pass	its ticket screen is the same function Helpdesk uses
✓ pass	only this app can write records — it has Records and Files, the others do not
✓ pass	and unlike the CRM app, it can sign a document and answer a ticket
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click the `.html` file. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ⋮ → **Add to Home screen**.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Your records live in your own browser on your own device — nowhere else, and never on anybody's server. Take a backup weekly: **Backup & Health** → **Export JSON**. To move to another device, carry the file and the backup, then **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It is not a different product from the other three — it is the same engine and the same screens, plus records and files.
- ▶ It does not upload anything anywhere. Your spreadsheet is read on your own machine and never leaves it.
- ▶ In this single-file form it does not pull live from your other systems; the hosted version of Medhava is what connects those pipes.
- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ **It will never ask you for a marketplace, bank or account password.** If any screen ever does, it is not Medhava.

Accepted when: the app opens by double-click with no internet · all 49 self-tests show pass · winning a deal moves the pipeline and the customer list at once · every refusal from all three apps still applies · an unloaded workbook lands with its bad rows refused by name · a backup exports and imports cleanly.
