

MODULE 01 OF 16

Dashboard & BI

CEO Dashboard · Report Builder · Group Consolidation · and all three in one

4 apps × 2 editions — Medhava (any industry) and Vastrangam

The layer that tells you what is happening. One app answers the three questions an owner asks every morning; one lets you ask anything else; one adds every company you run into a single honest set of figures. The fourth is all three at once, over records you can type, edit and upload — which is how you can check that the first three are telling the truth.

- 8 working apps
- 282 self-tests, all passing
- Zero console errors
- Every screen and button verified

What this module is

Module 01 is the **seeing** layer of Medhava. It reads what every other module writes and turns it into three things: a screen that tells you where you stand, a tool that answers any other question, and one honest set of figures across every company you run.

It is deliberately the first module built. Until you can see the business clearly, there is no way to judge whether the other fifteen modules are helping.

The four apps

APP	ANSWERS	SELF-TESTS
1 · CEO Dashboard	Did we make money? Is the cash safe? What needs me today?	30
2 · Report Builder	Everything else — asked your way, in three clicks	40
3 · Group Consolidation	Several companies, one set of figures, nothing counted twice	34
4 · All three in one	The same three, over records you can add, edit, delete and upload	37

Two editions of each

EDITION	WHAT IT IS
Medhava	The unified ERP. Industry-neutral names and rules — the same engine runs a machine shop, a distributor, an exporter or a professional practice. You change the master data, not the software.
Vastrangam	The same engine with Vastrangam's own world in it: three real companies, two seller names on one marketplace, mills, and a stitching arm with no registration of its own. Its purpose is to prove the neutral engine survives contact with a real business.

The engine is byte-for-byte identical between the two editions. Only the configuration file differs. Both editions pass exactly the same self-tests, with the same names — which is the proof that "industry-neutral" is real and not a claim.

One engine, four apps — and why that is the whole point

The four apps in this module are not four programs that were carefully kept in agreement. They are **one engine file and one screen file, compiled four times**.

FILE	WHAT IS IN IT	USED BY
the engine	The data model, the seed, the two dials, every derived figure, the report engine, consolidation, and the rules a row has to satisfy	All four apps
the screens	Overview, Sales, Money, Stock, Companies, Alerts, the report builder, the group roll-up, the company set-up	All four apps
each app's own file	Which screens it shows, which actions it allows, and its own self-tests	One app each
each edition's config	Names, companies, channels, items, examples. No arithmetic at all	One edition each

This is why "a report can never disagree with the dashboard" is a fact rather than an intention. When two apps each keep their own copy of "net sales = gross – returns", they agree right up until somebody fixes a rounding bug in one of them. Here there is one copy.

And it is held there by the build, not by memory. The audit refuses to pass if the four apps' configs carry different master data, or if the combined app drops one of the module's screens. Drift fails the build instead of reaching you.

All four apps use the same five steps. That is why they cannot produce different answers.

How the apps sit on the Data Core

Every Medhava module writes into one shared core. Module 01 is the module that reads it.

The five things the Data Core holds

ENTITY	WHAT IT IS	WHO WRITES IT
Item / SKU	One product or material, with its cost and reorder point	Catalog, Inventory, Purchase
Party	One customer, supplier or marketplace	CRM, Purchase, Channels
Stock	One quantity per item — not one per channel	Inventory, Manufacturing, Purchase
Ledger / Voucher	One money movement — sale, bill, expense, receipt	Accounting, Sales, Purchase
Order	One order in or out, with its lines and its channel	Sales, Channels, Purchase

"One business, one brain" is this table. Every other ERP problem — stock that disagrees between channels, a profit figure nobody can reproduce, a report that contradicts the dashboard — comes from having two copies of one of these five things. Medhava has one of each, and Module 01 proves it by reading them.

App 1 · CEO Dashboard

The Overview screen — Vastrangam edition.

- ▶ **Two live dials** — period (April, May, June, July, Full year) and company (one, or all of them together). Every figure on every screen is recalculated. Balances ignore the period, because a balance is a position — but they do obey the company.
- ▶ **Returns come off before anything is called "net"** — so a busy channel with high returns can never flatter the numbers.
- ▶ **Alerts nobody types in** — five rules run against live figures. You can clear one; it comes back on its own if the situation gets worse.
- ▶ **It writes nothing.** Two of its self-tests read its own code to prove it.

App 2 · Report Builder

Save report

Saved reports remember the source, grouping, filters and sort — not the numbers. Run one next month and it recalculates on the new data.

Pick, group, filter, run — Vastrapang edition.

- ▶ **Six sources** — Sales · Money owed · Stock · Running costs · Production · Purchases. Group any of them by anything, including by company.
- ▶ **Eleven ready-made reports**, each answering a real question, each a starting point you can change.
- ▶ **Top-N is honest** — ask for Top 5 and you get five rows, but the Total counts **every** matching row and says so.
- ▶ **Saving keeps the question, not the answer** — so a report built today tells you about next month when you run it next month.

A Sales report grouped by channel with no filters equals the CEO Dashboard's net sales figure exactly. Not by convention — by construction.

App 3 · Group Consolidation

Group figures with the arithmetic shown, not hidden — Vaistrangam edition.

- ▶ **What your companies billed each other comes back out** of group sales and group purchases — and never touches group profit, because both halves of an internal bill already cancel.
- ▶ **A company with no tax registration counts in every group figure and is refused a return.** Two different questions, both answered correctly.
- ▶ **A trading name is not a company.** There is a button that tries to make one into a company; watching it refuse is how you learn the rule.
- ▶ **Unlimited companies.** The software sets no cap; the plan does, and the refusal at the limit says so in those words.

Records: Files

Upload and download

Bring your Excel or CSV in, or save everything back out. No account, no internet, no library — it is all in this file.

Bring data in

Choose an .xlsx or .csv file

Download a blank template

Column headings are matched to fields by name. In any order, ignoring case and spacing — “Net Sales”, “net_sales” and “net sales” all land in the same place. Columns we do not recognise are left alone, not treated as an error: a real export from a bank or a marketplace panel always carries columns you do not want.

Company columns accept either the code or the full name. A row naming a company that does not exist is rejected with that reason, rather than quietly creating one — a typo should not become a fourth business.

Ready to bring in

Why the spreadsheet reader is written out in this file

Every other ERP loads a spreadsheet library from somebody else’s server. The day that server is slow, blocked or gone, the one button every customer presses on day one stops working — and the app was never really offline.

So the zip reader, the decompressor and the Excel parser are all here, in full, in the file you double-clicked. Turn off your internet and upload a spreadsheet: it works, because there was never anything to fetch.

It is the same rule this suite applies to books, AI, counters and payments. It would be a strange rule to hold for all of those and not for Excel.

An upload staged: two rows accepted, one refused by name — Vastrangam edition.

The same three apps, over one set of records, plus the two things that make the module testable: **you can change the records and you can upload a spreadsheet of them.**

- ▶ **Add, edit and delete** every table — companies, trading names, sales, purchases, costs, production, stock, money owed, opening balances, internal billing.
- ▶ **Upload .xlsx or .csv**, with the whole spreadsheet engine written out inside the file — so it works with the internet switched off.
- ▶ **Nothing is dropped silently.** Rows are staged, counted, and every rejection is shown with its line number and reason before anything is written.
- ▶ **Download everything back out** as Excel, CSV or a JSON backup — with the same headings the importer expects, so the round trip actually closes.

Test here, and you have tested all three. Type a sale and watch the dashboard, every report and the group roll-up move by the same amount. That is not three systems agreeing — it is one system shown three ways.

Opening it

1. **Pick your edition** — `MEDHAVA_...zip` for the neutral ERP, `VASTRANGAM_...zip` for the Vastrangam build. You can extract both; they do not collide.
2. **Extract it.** Windows: right-click → "Extract All". Mac: double-click it.
3. **Open the app folder** you want. Everything for that app is in it: the app, its manual, its PDF.
4. **Double-click the .html file.** Every filename starts with MEDHAVA_ or VASTRANGAM_ and carries the module and app number, so you always know which one you have open.

The one mistake to avoid: opening the HTML file directly from inside the ZIP. Windows unpacks it to a temporary folder that gets wiped, so your data appears to vanish. Always extract first.

All 4 apps can be open at once, in both editions. Each keeps its own data under its own name, so nothing collides — and in the hosted version they share one order book, which is what the Wiring screen in each app describes.

How this module was verified

Nothing in this document is a description of intent. Every app was built, opened in a real browser, and driven.

BUILD	SCREENS	CONTROLS CLICKED	SELF-TESTS	CONSOLE ERRORS
CEO Dashboard · Medhava	8 / 8	89	30 / 30	0
CEO Dashboard · Vastrangam	8 / 8	89	30 / 30	0
Report Builder · Medhava	5 / 5	74	40 / 40	0
Report Builder · Vastrangam	5 / 5	74	40 / 40	0
Group Consolidation · Medhava	7 / 7	75	34 / 34	0
Group Consolidation · Vastrangam	7 / 7	75	34 / 34	0
All three in one · Medhava	17 / 17	173	37 / 37	0
All three in one · Vastrangam	17 / 17	173	37 / 37	0

And one more check, which is the one that matters

The combined app is driven end to end the way a person would drive it: a sale is typed in, and all three figures — dashboard, report total, group total — are checked to have moved **by the same amount**. It is edited. It is deleted, and all three are checked to have come back **exactly**. A workbook is uploaded with one deliberately bad row, and the good rows are checked in and the bad one checked refused by name. The Excel export is then downloaded and re-read outside the browser, and the figures compared.

32 checks, both editions, all passing. A test that only proves a button can be pressed without an error is not worth much. These prove the buttons change the right numbers.
