

MODULE 14 · VASTRANGAM SUITE · v3.1

Vastrangam AI Engine

The catalogue workflow, rebuilt AI-first — photographs read by the app, competitors researched live, watermarks erased, 53 designed templates, and reels cut from your own shots.

Desire to Attire · Crafted in Surat. Worn Everywhere.

Vastrangam_AI_Engine.html · 511 KB · 76/76 self-tests pass · works offline, better with your key

What changed, and why

v2 was built offline-first: a rules-and-templates engine at the centre, with the model treated as an optional upgrade. That single decision is what made it mediocre — filenames instead of eyes, invented competitors instead of research, gradient boxes instead of design. v3 inverts it. The model reads the photographs, searches the live market and cleans the images; the offline engine is still there, but it now labels its own output DRAFT instead of overclaiming.

The workflow

The **Catalogue** is the top of the flow, and it no longer asks you to tag anything. Everything below reads from it.

The Catalogue — it reads the photograph

v2 matched filenames, so a camera-roll file like `WhatsApp Image 2026-08-06 at 00.49.42.jpg` produced the product name "Whatsapp Image AI", a blank colour and a pose defaulting to Front — thirty photos, thirty manual corrections. Now every photo is read: the garment, a premium colour name with its swatch, the likely fabric and craft, and the camera angle. Supplier watermarks and two-in-one collages are flagged on sight.

A catalogue after reading: one product resolved into two colour variants with their front / back / close-up / side poses. The WM badge marks a photo carrying a supplier watermark — erasable in one step in the Image Studio.

With no key connected the app falls back to filenames and marks every row **draft** — it says plainly that it is guessing rather than pretending otherwise.

The Content Engine — analysis first, then output

Your spec calls the analysis non-negotiable: the engine never jumps straight to a deliverable. v2 skipped it and invented the competitor section. Now every run produces the [PREFLIGHT] block — Product, Market, Competitor Gap, Buyer, Channel Plan, Uniqueness, Search Targets — with real named sellers and live URLs from a grounded web search, and only then writes the listing on top of it.

Feature highlights

- Roman Silk — medium weight, smooth hand-feel, holds a structured drape; reads premium, weighs almost nothing.
- Hand-mapped zari, scalloped gota-and-pearl hem, floral zari detailing.
- Built for the bride's own trousseau — done, never bridal.
- Custom-stitched to your measurements, XS to 3XL — not the usual four sizes.
- Dry clean only. Unsure of size? Custom sizing at no extra charge.

FAQ

ADD / SOE

What is the fabric and how heavy is it?

Roman Silk — medium weight, smooth hand-feel, holds a structured drape, about 600g.

Is custom sizing available?

Yes, XS to 3XL, custom-stitched to your measurements at no extra charge. WhatsApp your bust and waist to +91 87580 38163.

What occasion is it best for?

Built for the bride's own trousseau — mandap and natural light.

How do I care for it?

Dry clean only to keep the zari and the drape intact.

SEO blog opener

Copy

There is a specific panic that arrives about ten days before somebody else's wedding, and it is not about the reception. It is about the bridal. You cannot wear red — that is hers. You cannot wear yellow, because the courtyard is already yellow and you will be furniture in every photograph. This is the case for a mehendi green anarkali — and specifically a fluid roman silk one that photographs like money and weighs almost nothing... (continues)

A generated run: four title variants with character counts, the humanized Shopify body, and the specification table with no blank cells.

14 of 14 checks pass

These run on every generated pack. A fail means the pack should not ship as-is.

Title is 60–80 characters	pass
SEO Title ≤60 chars and unique	pass
SEO Description is 150–160 characters	pass
No meta shares 6+ consecutive words with another	pass
Every image alt text is ≤125 characters	pass
Alt text matches the Image SEO sheet exactly	pass
Exactly 30 hashtags, no duplicates	pass
Exactly 8 carousel slides, slide 1 carries the caption	pass
Image positions run 1..n with the hero at 1	pass
No forbidden token (3/4, xxl) anywhere	pass
Variant SKU written only for VS / VL	pass
Amazon title ≤200 chars and backend keywords ≤250 bytes	pass
Shopify sheet has exactly 61 columns	pass
Title, handle and opening hook are unique in the batch	pass

The QA gate is now your spec's real one — all fourteen machine-checkable rules, not ten approximations. Title 60–80, SEO description 150–160, exactly 30 hashtags, exactly 8 carousel slides, alt text ≤125 and synced, SKU written only for VS/VL, Amazon limits, and the 61-column count.

Image Studio — your own tooling, restored

v2 shipped an Image Studio with move, text, box and crop. Your own Image Studio Pro had six real inpainting algorithms, a watermark eraser, SKU stamping, frames and a batch queue. That was a downgrade, and it has been reversed: the algorithms are ported verbatim, and Gemini image editing is added alongside them.

Before — the supplier watermark across the top.

After — painted over and rebuilt with PatchMatch, offline and with no key, then the SKU stamped and a gold-corner frame applied. A heavy, high-contrast watermark like this one can leave a faint trace; ✦ AI erase (Gemini) resolves those cases.

One image, three formats, matched metadata

Download JPG + WebP + PNG gives all three at once, plus a metadata CSV carrying the title / description / alt text matched to that product's content — all in one ZIP.

Templates — 53 of them, all live

Nine canvas sizes × eight layout archetypes × palettes including one built from the garment's own colour. Nothing here is a picture of a template: every tile is drawn from your product photo and your content the moment the screen opens.

The gallery. Click any tile to open it on the canvas — edit the text, switch palette, switch layout, or magic-resize to another canvas and watch the layout refit itself.

The banner bug, and the fix

This is the specific defect that made the point. In v2 the web banner put "New Mehendi Collection" straight through the right-hand edge, dropped the subtitle on top of the title, and parked the price pill over both — on a green-to-blue gradient unrelated to the garment. That is not a styling slip; it is what happens when there is no layout engine.

The same banner now. Every string is measured and wrapped before it is drawn and shrunk until it fits its box; every element sits in a declared slot that is collision-checked against every other slot; the price is a pill sized to its own text; and the palette is derived from the garment's own colour.

Two of the 76 self-tests walk **every archetype at every canvas size** with a deliberately over-long title and assert that nothing leaves the canvas and no two elements overlap. The bug cannot come back silently.

Carousel · VAN4873

Carousel — 8 slides ready

Ask the Engine

The carousel is exactly eight slides now, per your spec — and each slide carries the real copy as its headline, with the stage name as a tag.

Video Studio — cut from your photographs

v2 animated a purple rectangle and a gold bar over black, and never touched your images. Now every pose in the catalogue becomes a moving shot — a slow push-in and pan, cross-dissolved into the next — with the three-act script and the price landing on the right frames.

The screenshot displays the Video Studio interface. The main preview window shows a green gradient background with the word "RAJPATH" in white. Below the preview is a timeline with a play button, a stop button, and a duration of 0.0s / 20s. The timeline has markers every 2 seconds from 0s to 20s. Below the timeline are four tracks: BG (Background), Video (containing eight "photo" clips), Shape (containing a "rect" clip), and Text (containing a "VASTRANGAM" clip). On the right side, there are three panels: "Add clip" with buttons for "+ Text", "+ Shape", and "Set BG", and a dropdown menu to "pick a run"; "Aspect" with buttons for "9:16 Reel", "1:1 Square", and "16:9 Wide"; and "Export" with buttons for "WebM", "GIF", "Frames (ZIP)", and "JSON". A note in the Export panel states: "MP4 / H.264 is not encoded in-browser — see [Connectors](#) for the render service. Everything above works with the wifi off." At the bottom right, there is a button that says "Ask the Engine".

A reel cut from eight catalogue photographs. The timeline shows one photo clip per pose on the Video track, with the script on the Text track. Exports WebM, GIF and a PNG frame sequence, offline.

Honest limit: real AI video generation (Veo) is a paid service. This animates your stills — which is what the free tier can actually do well.

Free-first AI, and what it costs

Everything is free-tier. Your key is stored in your browser only — never in the file, never committed anywhere.

The limits, stated plainly

Capability	Free allowance	What that means for you
Reading photos (vision)	~1,500 calls/day	30 photos a day, many times over
Live competitor research	5,000 grounded searches/month	~160 researched runs a month
AI image cleanup	~500 edits/day	far more than a catalogue shoot needs
Everything else	unlimited, offline	generator, canvas, timeline, spreadsheets, templates

The app queues its calls to stay inside the rate limit, backs off and retries on a 429, and caches every result by image hash — so re-running the same catalogue costs nothing at all.

Connectors — the free-first router. The built-in engine is first and can never be removed; paid providers sit last; nothing is locked to one company.

Two bugs found in the field, and the library

“The self-tests fail after I upload photos”

Root cause: v3 kept a 768px working copy of every photograph inside the record, and the record lives in the browser's 5 MB local storage. Measured on real photographs that is 377 KB each — thirty of them reached 11 MB, the browser refused to save, and the failure was swallowed. Nothing persisted, so after a reload the data was gone and the very first self-test failed. Photographs now live in IndexedDB and the record keeps only their ids.

	v3	now
Record after 30 photos	11.41 MB	53 KB
Browser save	QuotaExceededError, silent	saves, and says so loudly if it ever cannot
Self-tests after reload	failing	76/76 pass

“I checked every Gemini model and the error keeps coming”

Root cause: the model name was hardcoded. A retired id returns 404 no matter how good the key is, so every model looked broken. CORS was ruled out by direct test — Google does allow a local file to call the API. The fix is to stop guessing: the app now asks your key which models it can use, ranks them, and picks the best one itself.

Connectors → Diagnose: it checks the key format, lists what the key can really use, then calls each model for real and prints the exact reply — 200 OK, 404 model not found, 400 API_KEY_INVALID, 429 quota — before switching to whichever works.

A Gemini API key begins **Alza**. A token beginning **AQ.** or **ya29.** is an OAuth token and will never authenticate here — the Diagnose screen now says so in plain words instead of letting you hunt through model names.

The stock library

Three tiers, cheapest first. The built-in set is drawn by the app rather than stored as pictures, so it is sharp at any export size, recolours with your theme, costs almost nothing in file size, and works with the wifi off.

Paisley, mandala, lotus, marigold, diya, jaali, bandhani, peacock, kalash and rangoli; temple borders, zari bands, gold corners and scallops; sale tags, ribbons, rosettes, price flags and starbursts; grain, silk sheen, bokeh, mesh, paper and chevron; plus trust icons. Every one has → Image and → Design.

Tier	Needs	Good for
Built-in	nothing — offline	motifs, borders, badges, textures, icons
My assets	nothing — your uploads	your own logos, props and past picks
Stock photos	Openverse: no key · Pexels/Unsplash: free key	real photographs of people and places
AI generated	Gemini key, or Pollinations with no key	a backdrop that does not exist yet

How it was verified

76/76 self-tests pass · every screen driven in a real browser with zero console errors · with all non-file requests blocked the app still reads a catalogue, generates a full pack at QA 100%, renders all 53 templates and builds the 8-slide carousel — 0 external requests.

The regressions that are now locked down

the banner bug	no template lets text run off the canvas · no two elements overlap
the sheet	61 columns, not 23 · CSV is real comma-separated Shopify import
the counts	exactly 30 hashtags · exactly 8 carousel slides
the windows	title 60–80 · SEO description 150–160 · alt ≤125
the locks	Variant SKU only on VS/VL · size token 2xl never xxl · sleeve never 3/4
the catalogue	a WhatsApp filename yields no invented product name
the image studio	all six inpainting algorithms present and running
the storage bug	no raw pixels in the record · 30 photos stay under 1 MB · survives a reload
the model bug	models discovered from the key · newer families ranked first · an OAuth token is named as such

It will never ask for a password. Channels use scoped, revocable keys only. If any screen asks for a marketplace, bank or account password, it is not this app.
