

VASTRANGAM

PLAN OF ACTION — VASTRANGAM GROUP BUSINESS OPERATING SYSTEM

How to read this

The last version presented modules in build order — 16, then 07, then 11, then 04 — which is unreadable as a plan. This one runs **MODULE 01 → MODULE 16 in sequence**.

Every module carries the same seven headings, so any two can be compared at a glance:

what it is · its apps in a numbered table · every point it must carry · what it reads · what it writes · a wiring diagram · what "done" means

Build order is a **separate section at the end** (Part D). "What is module 5" and "what do we build third" are different questions, and mixing them is what made the last version useless.

Nothing here gets built until you have read it and said so.

A · THE COUNT

16 modules · 78 apps · 16 built. `modules.js` says 65; that file predates the feature-gap additions, the BUSY accounting specification and the Power BI prompt. Thirteen apps had no home anywhere, four of them in accounting alone.

Modules stay at 16 — the ERP prompt's 20-module cut is the same ground sliced differently (Identity + Settings → 16 · Master Data → 07 · Finance-Books + Finance-Reports → 11 · Communications → 16 · Documents → 02).

B · HOW THE WHOLE THING FITS

Everything funnels into **one stock number** and **one ledger**. That is what makes the dashboard true and every current app false — today each keeps its own copy.

The one law: every figure traces to a record, every record traces to the document that created it. No screen keeps its own counter.

C · THE MODULES

MODULE 01 · DASHBOARD & BI

See the whole business without asking anyone

What it is. Every number rolls up here as work happens — no exports, no month-end wait, no asking three people for their sheet.

Apps — 4 (3 built)

#	App	Must do
1	CEO Dashboard	cash, sales, stock, profit, alerts on one screen ☒ built
2	Report Builder	drag fields into a report, save for the team ☒ built
3	Group Consolidation	several companies, one set of figures, inter-company removed ☒ built
4	Excel Dashboard Builder	NEW — the 9-sheet workbook from 14 source tables

Every point it must carry

- Every number is a **query on the ledger and the stock table** — never a separate counter
- **Every sheet shows Vastrangam / Ethnic Fashion / Adini + one CONSOLIDATED row. No exceptions**
- Consolidated is `=SUM` of the three above it, never a separate calculation
- Group P&L = $\Sigma(3)$ – inter-company sales – inter-company purchases
- A company with no tax registration of its own still belongs in the group figures
- 9 dashboard sheets: Index · Financial Summary · HR · Purchase · Sales · Inventory & Production · GST · Expenses
- 14 source tables; FY auto-detected from the data, never hardcoded; zero hardcoded values
- 5 role dashboards: Admin · Manager · Staff · Karigar · Customer
- Refresh under 10s; stock query under 500ms

Reads every module · **Writes** nothing

Done when every figure on every screen can be clicked down to the ledger entry or stock movement behind it, and the three companies plus consolidated appear on every sheet.

MODULE 02 · CRM

Know every customer completely — and answer them fast

What it is. One record per customer carrying every lead, order, return, document and conversation, whichever channel it came from.

Apps — 4 (3 built)

#	App	Must do
1	CRM & Customer 360	lead to won, then the full lifetime  built
2	Documents & eSign	filed against the record, not a folder; signed copy files itself back  built
3	Helpdesk & Live Chat	chat/email/phone become tickets tied to the order  built
4	Forms & Feedback (NPS)	NEW — post-delivery NPS feeding design analytics

Every point it must carry

- Pipeline, locked: **Lead** → **Qualified** → **Quoted** → **Negotiation** → **Won** → **Lost**; advance stops at Negotiation because Won/Lost are explicit decisions
- Sources, locked: IndiaMART · Website · WhatsApp · Walk-in · Forum
- Follow-up when an open lead is untouched ≥ 7 days; Won/Lost never follow up
- Win rate = won / (won + lost), null when there are no decisions
- Lifecycle by order count: **New ≥ 1** · **Repeat ≥ 2** · **Loyal ≥ 4** · **VIP ≥ 7** ; 90 days idle → Lapsed
- Triggers: VIP welcome exactly at the 7th order · win-back when a Loyal/VIP goes 90 days idle (a lapsed New gets none) · review request 3 days after first delivery
- D2C + B2B + export + walk-in + WhatsApp merge to one customer by mobile and email
- Marketplace customers stay separate — panels share no PII — but are tied by pattern
- **NPS answers attach to the design**, so you learn which designs draw complaints

Reads every module · **Writes** Sales · OMS · Marketing

Done when one customer's whole history — every channel — is on one screen, and a 7th order fires the VIP trigger by itself.

MODULE 03 · SALES

Every way you sell, one order book — to the doorstep

What it is. Counter, wholesale, export and your own website write to the same order and draw on the same stock number. A sale is finished when it is delivered and the COD money is in.

Apps — 7 (5 built)

#	App	Must do
1	D2C Sales	Shopify/Woo/custom, cart to dispatch, loyalty, partial COD ☒ built
2	B2B & Credit	credit limits, tier pricing, ageing ☒ built
3	Export	commercial invoice, packing list, LUT, IGST refund ☒ built
4	POS	counter billing on the same stock as the website ☒ built
5	Quotes & Proforma	quote → confirmed order in one click ☒ built
6	Couriers & AWB	book on the order, compare couriers, print, follow to the door
7	Subscriptions	NEW — recurring/festive boxes, auto-invoice, dunning

Every point it must carry

- Shopify webhooks: order created → reserve stock → invoice → fulfilment; paid → picklist; cancelled → release stock. Inventory pushed **to** Shopify every 15 min so it never oversells
- Three shopping modes: Shop · Swipe/Lookbook · Customisation (upload reference, negotiate, 50% advance, becomes a production order)
- **Partial COD**: ₹99 default advance on Razorpay, balance collected at the door, remitted by the courier, **both legs auto-reconciled to one invoice**
- Loyalty: ₹100 spent = 1 point, 6-month expiry; tiers New 10% · Regular 3+ 15% · Loyal 7+ 20%
- B2B tiers: Silver <₹2L · Gold ₹2L–10L · Platinum ₹10L+, setting discount and terms
- Credit checked before acceptance; reminders –3 days, +1 day, **+7 days soft block** with override
- Export: FOB/CIF/EXW, LUT bond, shipping bill, FIRA, IGST refund tracking, **FX variance posted to FX gain/loss**; INR/USD/EUR/GBP/MYR at RBI daily rates
- Quote numbering **Q** - {FY} - #### , proforma **PI** - {FY} - #### ; export/LUT lines are 0% GST
- Delivery date is **derived** — cut-off + transit from the warehouse that actually has stock — never typed. An order no warehouse can serve gets **no date at all**

Reads Inventory · CRM · Warehouse · Logistics · **Writes** Inventory · Accounting · Warehouse · Logistics

Done when an order placed on Shopify appears within 60s with stock reserved and an invoice raised, and a partial-COD order reconciles both legs by itself.

MODULE 04 · E-COMMERCE / OMS

Every marketplace and your own website, one queue

What it is. Seven seller panels and your own store in one pipeline, one stock number going back out to all of them — and the money side closing in the same module.

Apps — 9 (2 built)

#	App	Must do
1	Marketplace OMS	one queue, real channel stages, per-channel cut-offs  built
2	Order Management	new → delivered whatever the source  built
3	Manual Data Check	upload the sheets you already download, 10 cross-checks back
4	Reconciliation	payout matched to the order line that earned it
5	Claims & Disputes	shortfalls, weight disputes, lost parcels — filed with evidence
6	Returns / RMA	customer, courier, wrong — and the dead stock they cost
7	Channels & Storefronts	connect once, stays in step; switchable without touching data
8	Labels & Documents	crop, own code large, invoice merged, batch print
9	Listing & Catalog Manager	NEW — bulk push, detect listed-but-out-of-stock

Every point it must carry

- Channels: Amazon · Flipkart · Myntra · Meesho · Ajio · **Nykaa** · **JioMart** + Shopify · WooCommerce · Magento · Wix · custom
- Orders pulled every 15 min, **idempotent by external ID**, raw JSON stored before normalising
- **Queue sorts by time remaining, not time received** — Amazon gives 12 hours, Ajio 48
- Day grouped by product so an item is picked once, not once per parcel
- Commission is **read from the settlement file, never assumed**
- Return costs: **customer ₹20 · courier ₹5 · wrong = full selling price, dead stock, never restocked**; a repeat pattern is flagged as marketplace abuse
- Price parity checked across all panels — a leftover festival discount buries your listings
- Labels **never uploaded to an outside website** to be cropped
- A channel's own downloaded report is a first-class input where there is no API
- A trading name a channel knows you by is a label on the channel, **not a second company**
- Stock reserved on pull, auto-released after 48h

Reads Inventory · CRM · Sales · Accounting · Logistics · Settlement · **Writes** Inventory · Accounting · Warehouse · Logistics · Settlement

Done when a full week runs with every channel live, settlements reconciled, and no panel oversells.

MODULE 05 · WAREHOUSE

Pick right the first time — and prove what you sent

Apps — 3 (0 built)

#	App	Must do
1	Picking & Bins	pick lists naming the bin, in walking order
2	Barcode Operations	scan to pick, pack, dispatch and stock-count from a phone
3	Packing Video	every parcel filmed, indexed by order number

Every point it must carry

- Bin-level instructions so a picker is never sent to an empty rack
- The same scan whatever the channel — marketplace, storefront or counter
- Physical stock count from the phone, posting movements live
- **Footage attaches itself to the claim that needs it** — a wrong-item dispute is answered with the clip, not with memory
- Every scan writes a stock movement; nothing moves without a row

Reads Sales · OMS · Inventory · **Writes** Inventory · Sales · OMS

Done when a parcel is picked from the right bin, filmed, and its clip is already attached when the claim arrives.

MODULE 06 · LOGISTICS

The courier network — rates, failures and the COD money

Apps — 4 (+1 optional) (0 built)

#	App	Must do
1	Rates & Zones	every courier's card by zone, weight slab and service
2	NDR & RTO Rescue	work a failed delivery while it can still be saved
3	COD Remittance	collected at the door vs reached the bank, parcel by parcel
4	Handover & Manifest	expected out vs actually taken, with a one-time code
5	Fleet <i>(optional)</i>	NEW — own vans: fuel, maintenance, trip costing

Every point it must carry

- Cheapest **and** fastest option known before booking, not after
- NDR: auto WhatsApp/call to reconfirm the address → reattempt or cancel, **before** it becomes a return you pay for twice; RTO analytics by pincode and courier
- COD: every shortfall named and aged; the second leg of a partial COD reconciled here
- Manifest: a signed record of parcels left behind, **so a parcel lost between your table and their van has an owner**
- Freight posts to the ledger; export courier costs separated

Done when COD collected reconciles to COD banked parcel by parcel, and an NDR is worked before it turns into an RTO.

MODULE 07 · INVENTORY & CATALOG

One number everyone trusts

What it is. The most important number in the system — one quantity per SKU, per location, per stage, read and written by every other module.

Apps — 4 (0 built)

#	App	Must do
1	Stock	live quantity by SKU × location × stage, reorder, batches, dead stock
2	Catalog / PIM	one product record every channel lists from
3	Kit & Combo SKU	NEW — a set sold as one listing decrements each component
4	Master-Data Hygiene	NEW — fuzzy duplicate detect and merge

Every point it must carry

- **One stock number, event-driven — not per channel.** The last piece sold on Amazon leaves Flipkart in the same instant, not three hours later as a cancellation, because cancellations are what account ratings are lost to
- Stages: raw → cut → stitched → thread-cut → QC passed → ironed → packed → dispatched
- **Movements are the ledger; quantities are the running balance.** Every transition is a row
- 4-level SKU: **Brand → Design → Style-Variant → SKU**, {BRAND}-{DESIGN}-{COLOR}-{SIZE} . The string is **derived**; search and analytics use the structured fields, never substrings
- Closing = Opening + Net Purchase + Production (Set + Unset + Job Work) – Net Sales
- **Wrong returns are dead stock — never added back**, held in their own register
- Valuation method explicit: FIFO / weighted average / specific cost — it sets the balance sheet, and stock value must equal the balance-sheet figure
- Multi-UOM: fabric bought in kg, sold as pieces, converted through the BOM
- Consignment stock in a channel's warehouse is a location like any other — counted, valued and aged, not invisible until it sells
- Dead stock: not moved 60+ days, ranked by tied-up capital
- Catalog holds **the code each channel knows this product by**, and the **packed size and weight** that decide the courier rate and settle every weight dispute
- Listing state per channel — live, awaiting approval, blocked, archived — with a quality score
- Status flags: ● ≥10% of opening · ● <10% · ● negative · ● dead stock

Reads every module · **Writes** every module

Done when stock is one number across every channel, a kit sale decrements all components, and stock valuation equals the balance sheet.

MODULE 08 · MANUFACTURING

Know what a unit really costs to make

Apps — 6 (0 built)

#	App	Must do
1	PLM & Development	idea → spec → sample rounds → costed trial → sign-off, versioned
2	Production Orders	your own stages, WIP visible at each
3	Piece-rate & Contractors	pooled completion, per-unit rates, rework, advances
4	BOM & Consumption	what each product consumes, at today's rates
5	Quality Control	accept / reject / rework, reasons feeding the supplier scorecard
6	Maintenance	machines and tools: due, last done, cost, downtime

Every point it must carry

- 10 stages: purchase · material check · sampling/3P · pattern+cutting · stitching · thread cut · QC · iron · packing · dispatch
- Four production modes: self · full job work · partial job work · mixed
- BOM versioned; sample BOMs separate from bulk (different wastage %)
- 7 named third-party services: embroidery · digital print · foil · hand dyeing · handwork · full stitching · partial stitching
- **Performance flags:** same person + same design + same task + similar qty → hours > previous × 1.2 → flag → WhatsApp asks why → 5 preset reasons auto-approve, custom needs admin

Karigar costing — locked, and already implemented and tested

- **23 garment columns → 13 set types**
- **Pool across ALL karigars per design first**, then apply the set formula
- **Sets = min across the populated member columns.** Lehenga Choli = MIN(Blouse, Lehenga, Dupatta) when Dupatta > 0, else MIN(Blouse, Lehenga). Anarkali-only → MIN(Anarkali, Dupatta), or Anarkali alone
- **Extras named** — Extra Anarkali, Extra Plazo — never a generic bucket. **No "Total Pieces (Set + Extra)" column anywhere**, explicitly rejected
- **Cost is per raw piece, independent of set completion** — a surplus piece still gets paid
- Set type from the Rates Master; inferred only as a fallback, in the order Lehenga → Anarkali → Kurti Palazzo → Kurti Plazo → Co-Ords → single-column, **and flagged as inferred**
- Missing rate → **₹0 and a flag, never a guess**
- Alter earnings: + admin-assigned alter hours × ₹100 ; **own-mistake alterations = ₹0**

- Material: consumed = avg per piece × pieces produced; missing rate → N/A, never 0; three views (line, design, material) must agree or the output is marked untrustworthy

Acceptance gate (\$16A): 143 designs · 29 karigar units · **25,307 sets** · **59,110 pieces** · **₹26,90,062** · 5 no-rate designs flagged. A mismatch is a bug, not a new answer.

Reads Sales · Purchase · Inventory · **Writes** Inventory · HR & Payroll · Accounting

Done when three production orders run to completion — self, full job work, partial — and the \$16A totals reproduce exactly.

MODULE 09 · PURCHASE

Nothing over-billed gets paid

Apps — 2 (2 built )

#	App	Must do
1	Procurement	RFQ → PO → GRN with a strict three-way match  built
2	Vendor Management	vendor 360, payables, ageing, risk score  built

Every point it must carry

- Low stock triggers a requisition draft; admin converts to PO; system suggests the **priority-1 vendor with their last rate**

- Vendor escalation P1 → P2 → P3 on no response
- Last-rate auto-suggest: most recent PO rate for that vendor and material, else that vendor's most recent any-material rate, else null
- **3-way match locked: invoice must equal received qty × PO rate.** Flags — GRN qty ≠ PO qty · invoice ≠ grnQty × rate · invoice entered before GRN
- PO number `P0-{FY}-####` ; status DRAFT → SENT → GRN → MATCHED | MISMATCH
- Hygiene flags: a material with no priority-1 vendor; two vendors sharing priority-1
- Scorecard auto-computed per transaction: quality % · on-time % · rate vs market

Reads Inventory · Manufacturing · **Writes** Inventory · Accounting · Quality Control

Done when a vendor invoice for more than was received is blocked before payment.

MODULE 10 · HR & PAYROLL

Pay people right, on time

Apps — 3 (0 built)

#	App	Must do
1	Staff & Contractors	attendance, effective-dated salary, output earnings, one register
2	Time-off & Advances	leave, festival advances, and what they do to this month
3	Appraisal & Hiring	reviews, and a pipeline ending in an employee record (ATS)

Every point it must carry — these are FINAL, from the Combined Master Prompt

- Attendance codes `P · H · A · HL · OD · PL · UL`; blank = Absent. Pay multipliers {P 1 · H 0.5 · A 0 · HL 1 · OD 1 · PL 1 · UL 0}
- **Days-Equivalent = Present + Holiday + 0.5 × Half-days.** A holiday pays as a full present day

- **Daily Rate = resolved monthly salary ÷ resolved threshold DAYS**, both looked up for that specific month from the effective-dated logs
- Earning = Daily Rate × Days-Equivalent, **uncapped both ways** — 30 days against a 27-day threshold pays 30
- **Flat basis** — full salary every month regardless of attendance
- **Piece-rate basis** — no salary, no threshold, no attendance row; wage = Work Report hours × flat ₹/hr (₹100)
- Threshold days 28 (26P+4H), moving to 27 (26P+2H) for two men from Nov 2025
- Hours are **reference only**: male 10h weekday / 5h Sunday, female 8h / 5.5h. Threshold hours are a **legacy column that drives nothing**
- Blended FY Hourly Rate = blended daily rate ÷ that person's weekday shift, averaged over **months actually employed**
- Effective-dated salary: editing from one screen with an effective-from date auto-closes the prior period; past months keep their old rate; a future raise activates itself
- Three-state month: Not employed / **No Data** / real month. A blank month is a tracking gap, never "Below Average"
- Geofence 50 m, 15-minute buffer, late flags, admin override; EOD wizard
- Festival leave from a religion-based calendar; universal Diwali shutdown 4–5 days
- Advances deducted at payout; net may go negative and is flagged
- Staff are **Active / On Leave / Inactive** — **never deleted**

Reads Manufacturing · **Writes** Accounting

Done when a full month's payroll runs end to end with zero manual touch and reconciles to your own figures.

MODULE 11 · ACCOUNTING & GST

Books that always balance

What it is. A full double-entry ledger built for Indian compliance. **Medhava keeps the books on its own — no other accounting package is required, ever.** Tally, BUSY and Zoho stay as connectors for people who already run one; **no figure is ever sourced from them.**

Apps — 9 (0 built) — *the largest module, and 5 in `modules.js` was wrong*

#	App	Must do
1	Accounting	chart of accounts, 9 voucher types, one posting engine
2	Invoicing	GST invoices to the paise, templates, round-off, e-invoice IRN
3	Expenses	category capture, approvals, bill OCR
4	GST & Tax	CGST/SGST/IGST, TDS, TCS, GSTR-1/3B/9 per registration
5	ITC Reconciliation	NEW — GSTR-2A/2B matching
6	Receivables, Payables & PDC	NEW — bill-wise allocation, post-dated cheques
7	Fixed Assets & Depreciation	NEW — SLM <i>and</i> WDV
8	Year-End Close & Period Lock	NEW — carry-forward, locking
9	Finance Reports	P&L, balance sheet, profit by channel/product/SKU, MIS, ratios

Every point it must carry

- **One posting engine.** Every voucher writes the ledger through it — *"this is where most home-built accounting tools break"*
- 9 voucher types: Sales · Purchase · Credit Note · Debit Note · Payment · Receipt · Journal · Contra · POS. Credit/debit notes **must** reference the original invoice
- CGST+SGST vs IGST **auto-determined by comparing the two GSTINs' state codes** — never chosen by hand
- Rates default from HSN, overridable per line; **tax rates versioned by effective date** so old invoices stay correct
- RCM flag; **ITC-eligibility flag per purchase line** — some GST paid is not claimable
- **ITC reconciliation against GSTR-2A/2B** — without it, GSTR-3B is a guess
- **Bill-wise allocation** — a payment settles named invoices (FIFO or chosen), partial settlement, true per-invoice balance
- **Post-dated cheques** — a register posting on the realisation date, not the cheque date
- **Fixed assets — SLM and WDV both**, because book and tax depreciation differ; disposal P&L
- **Year-end close** — P&L resets, balance-sheet accounts carry forward, years stay separable
- **Period locking** — no backdated edit without an admin unlock, **and the unlock is logged**
- **Round-off posts to its own ledger** — never absorbed into the sale, which corrupts the GST
- TDS by section (194C, 194J...), Form 26Q, Form 16A; TCS on marketplace settlements
- Bank reconciliation by amount + date + reference; unmatched queued
- The 11 core reports: Day Book · Ledger with running balance · Trial Balance · P&L · Balance Sheet · Ageing both sides · Cash Flow · GST · TDS/TCS · **Stock valuation tying to the balance sheet** · BRS
- Ratios, Budget vs Actual, cost-centre P&L
- **The MCA audit trail** — every edit, old and new value, **cannot be disabled**, 8 years

- P&L structure is locked and reproduced exactly as specified

Reads every module · **Writes** Finance Reports

Internal build order, prescribed by the specification itself: posting engine first · audit trail wrapping every write from day one · Sales and Purchase Invoice verified against Trial Balance · the other seven vouchers · year-end and period locking · **GST returns and 2A/2B last.**

Done when one month of books closes cleanly and GSTR-1 + GSTR-3B generate and verify.

MODULE 12 · SETTLEMENT

Get paid what you are owed — cycle by cycle

Apps — 3 (0 built)

#	App	Must do
1	Payout Cycles	what should land, what did, on which day — late is visible the day it is late
2	Fee & Commission Audit	published rate card vs rate actually charged, by category and SKU
3	TCS & TDS Register	every rupee deducted, matched against the portal's own figures

Every point it must carry

- Portal **auto-detected from the file shape** — Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa
- Expected = SP – commission – TCS – GST; **flag variance > ₹1 or > 0.5%**
- **Commission never assumed** — read from the actual settlement file, invoice by invoice
- Variance categories: commission overcharged · TCS miscalculated · SPF higher than agreed · unbilled returns · **weight discrepancy · lost in transit**
- One-click dispute with an evidence pack; **a claim awaiting your response is worth money, one closed for no response is worth nothing** — so days remaining sit next to the amount
- **A silent commission increase is caught the first time it is applied**; the tier you are rated in is on the same screen, because losing a tier quietly costs more than any deduction
- Per-order and per-SKU P&L, 20 columns, profit after every fee
- Reconciled lines post to books with channel-specific GL splits
- **Acceptance gate: ≥98% settlement match; SKU profit within ₹10 of your records**

Reads OMS · Accounting · **Writes** Accounting

Done when a real settlement file reconciles ≥98% and the variances it finds are ones you agree are real.

MODULE 13 · MARKETING

Sell more without discounting

Apps — 6 (0 built)

#	App	Must do
1	Social Calendar	plan and publish across every channel from one calendar
2	Campaigns	email, SMS, WhatsApp measured on real revenue, not opens
3	Repricing Engine	floor, ceiling, match-lowest, festival overrides — and what each did
4	Automation	if this happens, do that — across any module, without code
5	Blog & Pages	articles and landing pages straight to your own site, meta set
6	Events	NEW — Surat expos: booth, budget, leads → CRM

Every point it must carry

- Calendar across 7 platforms; each card carries pillar, format, copy, hashtags, asset, music brief and an AI-generated flag
- Campaign spend pulled from the ad platforms; **ROAS computed on revenue**
- **A price that went up and took the orders down with it shows as exactly that, next to the rule that raised it** — so the rule is reversed on evidence, not on a feeling
- Every price change audited; repricing never breaks the single stock number
- Automation recipes seeded: stock below reorder → draft PO to the priority-1 vendor + WhatsApp the admin; B2B invoice 3 days from due → reminder
- Influencer CRM with collaboration history and payment timeline
- Asset library tagged by mood, occasion and colour, with an approved-for-use flag

Reads Inventory · CRM · **Writes** Sales · OMS

Done when a month of content publishes on schedule and a repricing rule can be judged on what it did to orders.

MODULE 14 · AI CONTENT ENGINE

Write it, shoot it, cut it — from the catalogue you already have

Apps — 5 (0 built on the core; substantial work exists standalone)

#	App	Must do
1	Content Engine	14 stages in your own voice, from research to alt text
2	Image Studio	layers, free transform, background removal, channel presets, alt text
3	Video Studio	text and image to video, reels and ad cuts per channel
4	Design Studio	templates, layers, undo/redo, exact sizing, PNG/JPG/PDF export
5	Publisher	one push everywhere, reporting what went live and what was rejected

Every point it must carry

- **The one law of content:** structured data (CSV, titles, attributes) gets keywords; anything a human reads gets feelings. Product nouns banned from creative surfaces, banned outright from song lyrics
- Self-improving loop: draft → 12-point self-critique → rewrite, with session voice memory
- Songwriting Mukhda → Antara → Mukhda, Hinglish, emotion not product, original lines
- Image Studio: all website-size presets incl. circle, auto-fit crop-fill, AI background and erase, Ctrl+T transform, layers, quality-first export, white background for marketplaces
- Design Studio: full design surface with elements, alignment, any-colour picker
- **Generation Studio stays badged a mockup until a paid API is wired — never presented as live**

- The Canva/Photoshop blueprint sets the depth: rendering engine split (Canvas 2D for layout, WebGL for pixels), command-pattern undo storing deltas, autosave as non-negotiable, video rendered server-side never in-browser. Its own estimate is **12–20 months for full parity**, so this module **ships in labelled stages**

Reads Inventory · **Writes** Marketing · OMS

Done when a listing generates for one design across six platforms in under 20 seconds and publishes, with rejections reported and explained.

MODULE 15 · PROJECTS & COLLABORATION

The work that is not an order — and the talking around it

Apps — 6 (0 built)

#	App	Must do
1	Projects & Cases	stages you define, owners, deadlines, documents, billable time, real cost
2	Timesheets & Planning	who is on what, hours in, billable separated from not
3	Approvals	one queue for everything waiting on a yes, with the rule that sent it
4	Forum	questions and answers that outlive a chat
5	Discuss	conversation attached to the record it is about
6	Knowledge Base	NEW — cutting SOP, QC checklist, packing standard, playbooks

Every point it must carry

- A project, case, engagement or job — the same record with different words on it
- Time and cost land **in the ledger**, not in somebody's inbox
- A rate card turns straight into an invoice and a real cost
- Every approval decision goes to the audit record
- **A year later the reason for a decision is still sitting next to the decision**

- Knowledge base is role-scoped and searchable

Reads CRM · Sales · HR · Inventory · **Writes** Accounting · HR · CRM

Done when billable time on a case becomes an invoice and a cost without being re-keyed.

MODULE 16 · PLATFORM

The spine every module runs on

What it is. Not a module you open — the layer underneath all the others.

Apps — 3 (1 built)

#	App	Must do
1	Identity, Settings & Audit	users, roles, permissions, company switching, tax setup, an immutable record of everything that ever happened
2	Ask & Print	ask from your phone; back as a PDF or on the office printer
3	Communications	NEW — WhatsApp commands, broadcasts, email, SMS, notifications

Every point it must carry

- Roles: Admin · Manager · Staff · Karigar · Customer, with the permission matrix
- **Per-company per-role** — Praveen and Vishal see all three; staff can be scoped to one
- Company switcher, default Vastrangam; **read-only Group view**
- Company ≠ brand ≠ prefix: Ethnic Fashion / Go4Fashion / EF / GF are separate fields
- Staff lifecycle Active / On Leave / Inactive — **no data is ever deleted**

- **Audit trail that cannot be switched off** — MCA rule, 8 years, before and after values
- Provider config: every capability has **3+ interchangeable vendors**, switchable in a click. A vendor name on the Connectors screen is the promise working; the same name as the **source of a figure** is a bug
- Environment variables encrypted; integration health green/red with last sync and error count
- WhatsApp commands **IN** **OUT** **LEAVE** **ADVANCE** **REPORT** **Print Invoice** **Print Barcode**
- 5 scheduled jobs: 8am schedules · 7pm stock summary · 8pm EOD reminder · B2B due reminders · 1st-of-month payroll
- Broadcast safety: official API only, 200/day warm-up, mandatory STOP keyword, time windows
- **This app will never ask for a marketplace, bank or account password**

Reads every module · **Writes** every module

Done when a karigar sees only their own earnings, an admin switches all three companies and the figures change, and every edit made during the test is in the audit browser.

D · THE ORDER TO BUILD THEM IN

Straight down the list: 01, 02, 03 ... 16. No reordering. You said module 1 to the last module, numbered 1, 2, 3 — that is the order.

The only thing that comes before Module 01 is the **Foundation** — the shared database, the audit trail and the cascade bus. It is not a numbered module; it is the ground all sixteen stand on, so it is laid once and then never touched as a "module" again.

Order	Module	Apps	Built	To build
Foundation	shared core: one database · audit · cascades	—	parked	wire it in
01	Dashboard & BI	4	3	Excel Dashboard Builder
02	CRM	4	3	Forms & Feedback (NPS)
03	Sales	7	5	Couriers & AWB · Subscriptions
04	E-commerce / OMS	9	2	7 apps
05	Warehouse	3	0	3 apps
06	Logistics	4 (+1)	0	4 apps (+ Fleet)
07	Inventory & Catalog	4	0	4 apps
08	Manufacturing	6	0	6 apps
09	Purchase	2	2	rewire onto the core
10	HR & Payroll	3	0	3 apps
11	Accounting & GST	9	0	9 apps
12	Settlement	3	0	3 apps
13	Marketing	6	0	6 apps
14	AI Content Engine	5	0	5 apps
15	Projects & Collaboration	6	0	6 apps
16	Platform	3	1	Identity/Audit · Communications

One honest note, not a request to reorder. Some modules read data that a later-numbered module writes — Module 01's dashboard reads the ledger that Module 11 fills. Built in order, each module is finished against the data that exists when its turn comes and grows richer as later modules land: Module 01 shows what is real on the day it is built, and the same screen shows more the day Module 11 is done. Nothing waits, nothing is faked, and the order stays 1 → 16.

Start with the Foundation, then MODULE 01.

E · THE STANDARD EVERY MODULE MUST MEET

A module is done only when all eight hold. This is written down so it cannot be quietly softened later.

- 1. Every app built, not stubbed
- 2. Reads and writes the shared core — no private store
- 3. Every cascade it declares actually fires, proved by a test
- 4. Figures reconcile to your own records (§16A where targets exist)
- 5. Real headless-browser run: every screen, every action, **zero console errors**
- 6. Both editions build — Medhava (industry-neutral) and Vastrangam
- 7. Manual, PDF and screenshots generated
- 8. Labelled honestly: **tool / stub / mockup / spec**

The end-to-end proof, re-run at every module boundary: sell one garment on a marketplace and follow it — order in OMS, stock down in Inventory, pick list in Warehouse, AWB in Logistics, revenue and GST in Accounting, payout matched in Settlement, karigar paid in Manufacturing, all of it on the dashboard. One transaction, eight modules, one database.

```
node core/tests/cascades.js           every declared cascade fires
node core/tests/acceptance.js         the §16A known-good totals
node brand/suite/deep/audit.js        structural audit
node brand/suite/deep/verify_mNN     real browser, zero errors
python3 engine/tests/selftest.py     the karigar/staff oracle stays green
```

F • WHAT EXISTS, AND WHAT I STILL OWE YOU

	Count	What happens
Deep apps (01, 02, 03, 04, 09, 16)	16	rewired onto the core when their module's turn comes in the 01 → 16 pass
Shallow demos in brand/suite/out/	16	superseded module by module, never deleted before their replacement is verified
Karigar/staff engine (Python, 251 tests)	—	ported when Module 08 and 10 come up, Python kept as the checker
core/ foundation code	—	built but parked — nothing depends on it

Still reading: 68 images, the Material tool spec, Part III's fuller Power BI text, the Universal prompt, one `.docx` . Recorded in `SOURCE_REGISTER.md` with line references.

Files still needed: `Vastrangam_Master_Excel_Sheet_[FY].xlsx` (14 sheets, contains the stitching rate master) · `Karigar_Reports_April_2025_to_June_2027.xlsx` (the §16A gate) · the 5 BUSY `.bds` files (opening balances).
