

Helpdesk & Live Chat

Every question tied to the customer and the order it is about

Module 02 · CRM — App 3 of 4

Chat, email and phone become tickets tied to the order they are about — with the history already on the screen.

- One file · opens by double-click
- Works offline
- The reply clock is derived, never typed
- 38 / 38 self-tests pass

What this is, and what is inside

A question arriving by chat, email or phone becomes a ticket against the party who asked it — with everything already known about them on the same screen.

A question arriving by any route becomes a ticket against the buyer who asked it, and usually against the order it is about. Whoever picks it up already has the whole history in front of them: what that buyer has bought, what came back from the marketplace, what is filed against them and what they asked last time. The first-reply clock is WORKED OUT from the messages rather than typed by anybody, so the number on the screen is the number that happened. A ticket cannot be closed without a single reply, and it cannot be attached to somebody else's order.

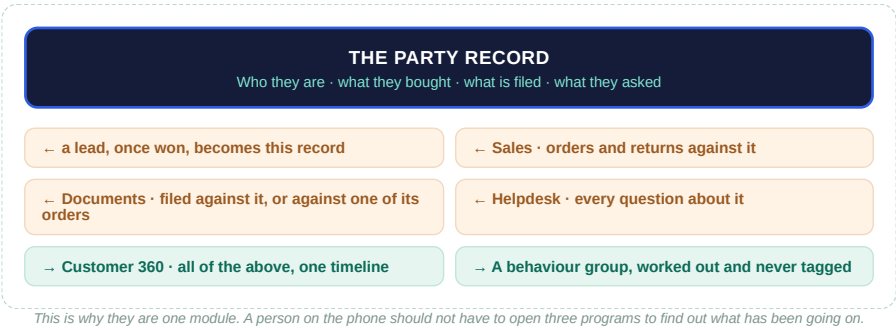

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic and its own rules **38 different ways** every time it starts.

What this document covers

1. What this is, and what is inside
2. The spine of this module: one record
3. Screen · The desk right now
4. Screen · Tickets
5. Screen · One ticket
6. Two things this app refuses
7. The clock, after one reply
8. Every figure, and where it comes from
9. Connectors — nothing is locked to one company
10. The three rules the app enforces on itself
11. What this app can be wired to
12. The 38 self-tests, in full (1 of 2)
13. The 38 self-tests, in full (2 of 2)
14. How to run it, and what it will not do

The spine of this module: one record

The three apps in Module 02 are not three programs that talk to each other. They are **three views of one record** — the party.

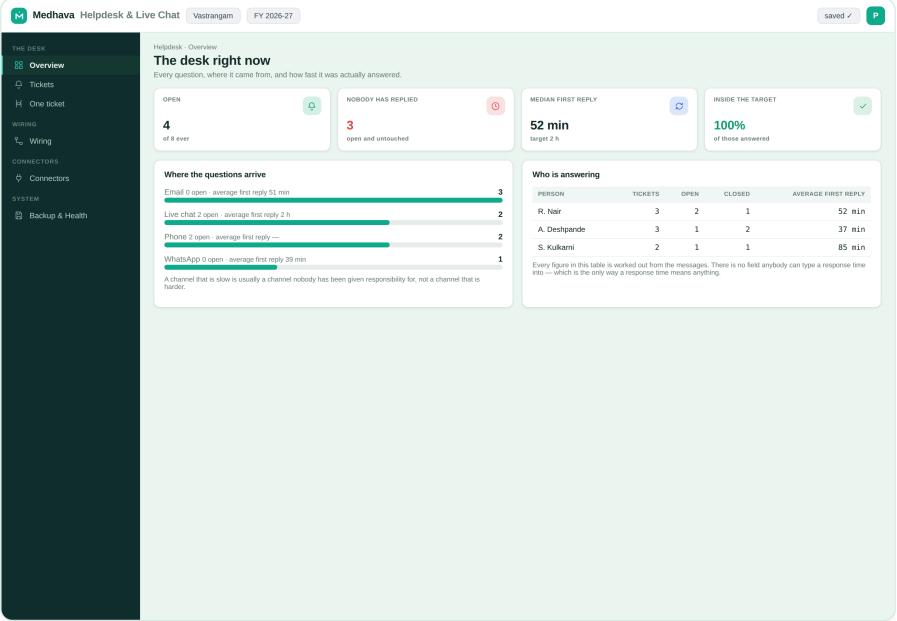

What this app reads, and from where

COMES FROM	WHAT IT SUPPLIES
CRM	The party the ticket is about, and everything already on their record
E-commerce / OMS	Marketplace orders and returns a ticket can name
Documents	What is already filed against that party or order
Platform	The reply and resolution targets you set
Logistics	Where a delivery actually is, when that is the question

All four apps of this module are built from one engine file and one screen file. Not four codebases that agree — one implementation, compiled four times.

Screen · The desk right now

Open, unanswered, the median first reply, and how much of it landed inside the target.

Every figure on this screen is worked out from the messages. There is no field anywhere holding a response time — a self-test checks that there is not. A support metric anybody can type is a support metric that will be typed, and then the number on the wall stops meaning anything.

"Where the questions arrive" is usually more useful than it looks: a channel that is slow is normally a channel nobody has been given responsibility for, not a channel that is harder.

The conversation on the left. Everything already known about the person asking, on the right.

The right-hand panel is why this app is in the same module as the customer record. What they are worth, what they have sent back, how long since they ordered, their behaviour group, and every document already on file — before anybody says a word. A helpdesk bolted on beside a CRM makes somebody join that up in their head, on the phone, while a customer waits.

Two things this app refuses

That was refused

Nobody has answered Kanchi Silks House yet. A ticket closed without a single reply is a customer who was ignored and then marked "resolved" — so this is refused.

Closing a ticket nobody has answered. Refused.

A ticket closed without a single reply is a customer who was ignored and then marked "resolved". It is the easiest way to make a support report look excellent, so it is refused rather than discouraged.

That was refused

Order SO-1001 belongs to Rajmandir Wholesale (Surat), and this ticket is Kanchi Silks House's. Attaching it would put one customer's delivery on another customer's screen.

Sent — the first-reply clock is worked out from this

One message sent. The first-reply figure appeared immediately, because it is the gap to that message.

1

A ticket has an **opened** time — when the question arrived.

2

Every message carries a time and a side: **the customer**, or **us**.

3

First reply = opening → **our first message**. That is the whole calculation.

4

There is nowhere to store it, so there is nothing to disagree with.

And the same ticket now shows on that customer's **Customer 360** timeline, with the reply time on it. Not copied there — read from here.

Medhava · Helpdesk & Live Chat — Vastrapuram edition

8 / 15

Every figure, and where it comes from

This is the same table as the app's Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Open tickets	This app	Every ticket with no closing time on it
Not answered yet	This app	Open, and nobody on our side has written a single message
First reply time	This app (the messages)	The gap between the ticket opening and our first message on it — worked out, never typed
Within the reply target	This app + Platform (settings)	First reply time against the target you set — 120 minutes as it ships
Who the ticket is about	CRM	The party record, with everything already known about them
Which order it is about	E-commerce / OMS + Sales	One of that party's own orders — attaching anybody else's is refused
Documents to hand	Documents	Anything filed against that party or that order, ready to send
By channel and by person	This app	Where the questions arrive and who is answering them

The rules of the whole module, in one place

RULE	WHAT IT MEANS IN PRACTICE
One party, never two	Winning a deal for an organisation already on the books attaches to that record. Two records for one customer means two answers to "what are they worth".
A document belongs to a record	Not to a folder. Filing against a record that does not exist is refused, because the document could never be found from the only place anybody looks.
A signature is a one-time code	Six digits, to the named signer, back from them, recorded against the document. No code, no signature — including on import.
The first-reply clock is derived	The gap between the ticket opening and our first message. There is no field to type it into.
A ticket cannot be closed unanswered	Ignoring somebody and marking it "resolved" is refused.
A ticket names its own party's order	Attaching anybody else's is refused, on screen and on import.
Behaviour groups are rules	Order count and days since the last order. Nobody tags anybody by hand, so nothing goes stale.

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service.** Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

The three rules the app enforces on itself

- 1

No capability has only one choice. Every one has at least three; most have eight to twelve.
- 2

Every capability has a built-in or by-hand option — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3

Every capability has an option you can host yourself — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

Helpdesk & Live Chat uses **5** capabilities and offers **48** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajio · Nykaa · JioMart · Shopify · WooCommerce · Medusa / self-hosted store
Automation	Medhava Rules · n8n (self-hosted) · Node-RED (self-hosted) · Windmill (self-hosted) · Apache Airflow · n8n Cloud · Make · Zapier · Pipedream · Cron + webhook · Do it by hand
Customer messaging	Copy the message and send it yourself · WhatsApp Cloud API · Gupshup · Interakt · MSG91 · Twilio · Email instead (any SMTP) · Chatwoot (self-hosted)
Email sending	Download the PDF and email it yourself · Any SMTP server · Amazon SES · SendGrid · Postmark · Mailgun · Zoho Mail · Brevo
Files & backups	This device · A USB drive · MinIO (self-hosted) · Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2

Cloud services use a **scoped, revocable key** — **never your password**. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password**. If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 38 self-tests, in full (1 of 2)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	every button this app offers is really on one of its own screens
✓ pass	every ticket is about a party that exists
✓ pass	every ticket that names an order names one of that party's own orders
✓ pass	there is an answered ticket
✓ pass	its first-reply time is the gap to our first message, worked out
✓ pass	a ticket nobody has answered has no first-reply time at all
✓ pass	there is no field anywhere holding a response time
✓ pass	the median first reply is a real number from the real messages
✓ pass	the "inside the target" figure only counts tickets that were answered
✓ pass	there is a ticket nobody has answered
✓ pass	and it shows as not answered
✓ pass	answering it gives it a first-reply time immediately
✓ pass	and it drops off the "nobody has replied" list
✓ pass	an empty reply is not sent
✓ pass	a ticket with no reply on it cannot be closed
✓ pass	the refusal says the customer was never answered
✓ pass	a ticket that has been answered can be closed
✓ pass	closing it twice is refused
✓ pass	attaching another party's order to a ticket is refused

The 38 self-tests, in full (2 of 2)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	the refusal names both parties, so the mistake is obvious
✓ pass	attaching an order that does not exist is refused
✓ pass	attaching one of their own orders works
✓ pass	the party behind a ticket carries their whole history
✓ pass	and their documents are to hand from the ticket
✓ pass	every ticket appears on that party's timeline
✓ pass	tickets are grouped by the channel they arrived on
✓ pass	every channel total adds back up to the ticket count
✓ pass	every person's totals add back up too
✓ pass	this app can do six things, and none of them edits an order or a party
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

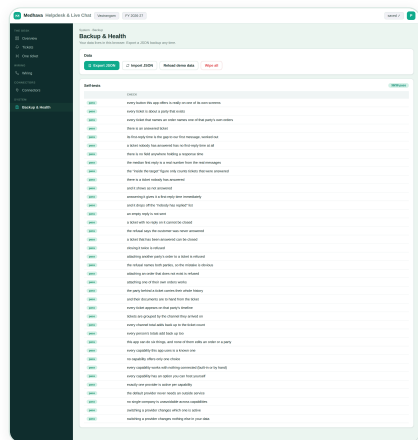

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click the `.html` file. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ☰ → **Add to Home screen**.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Your records live in your own browser on your own device — nowhere else, and never on anybody's server. Take a backup weekly: **Backup & Health** → **Export JSON**. To move to another device, carry the file and the backup, then **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It does not connect to a live chat widget in this single-file form; the hosted version of Medhava is what connects those pipes.
- ▶ It will not let anybody set a response time. That is the point of it.
- ▶ In this single-file form it does not pull live from your marketplace panels; the hosted version of Medhava is what connects those pipes.
- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ **It will never ask you for a marketplace, bank or account password.** If any screen ever does, it is not Medhava.

Accepted when: the app opens by double-click with no internet · all 38 self-tests show pass · the first-reply time is worked out from the messages and cannot be typed · a ticket cannot be closed unanswered · a ticket cannot be attached to another customer's order · a backup exports and imports cleanly.
