

MEDHAVA

Medhava — one business, one brain

One Business Operating System for any trade: 31 modules and 165 apps over one shared data core.

This file is the whole system in plain text — every module, every app, and what each one reads and writes. It is generated from `brand/site/modules.js`, the same file the website and every PDF read, so nothing here can disagree with them. The counts below are not typed in; they are counted from that file each time this page is built.

Modules	31, in dependency order — a module comes only after everything it draws on
Apps	165
Companies	As many as you have. A company is a row, not a setting — the shipped plan caps a subscription at 20 and the software itself has no ceiling
Shared data core	Company · Item/SKU · Party · Stock · Ledger/Voucher · Order
Key difference	Not a suite of integrated apps. One application over one database, so there is no sync step and no second copy of any master record
Compliance	Double-entry books with CGST/SGST/IGST, TDS, TCS, input credit on accepted goods, GSTR-1 and GSTR-3B, filed per registration
Channels	Any storefront, marketplace, counter, wholesale desk or export buyer — read from your own data, never from a list inside the code
Security	Row-level isolation per company; outside services connect with scoped, revocable keys — never account passwords
Deployment	Hosted, or single-file apps that run by double-clicking with no install and no internet

The one idea

Every module reads and writes the **same six records**. That is the physical reason a single goods receipt can touch stock, the books, quality and sourcing in the same instant.

every one of the 165 apps reads and writes these, and only these

One stock number, not one per channel. The last unit sold at the counter disappears from every marketplace you sell on in the same instant — not three hours later as a cancellation, because cancellations are what a seller rating is lost to.

Accepted — not ordered — is what counts. You order 100 units. 100 arrive. Quality accepts 96. Most systems increase stock by 100 and claim tax credit on 100. This one increases stock by **96**, claims input credit on **96**, raises a debit note for the 4 rejected, and lowers that supplier's accept rate — automatically.

Nothing derived is ever stored. Outstanding, ageing, risk, promise dates, cost per piece and profit per design are recomputed on read. A stored total is a number that can drift away from the documents underneath it; a computed one cannot.

How one order moves through it

The test of whether this is one system or 165 programs sharing a login: take a single order and follow it. The words below are a product business's; a clinic, a law practice and a freight desk run the same eight modules with their own words on them.

sold on a marketplace

one transaction · eight modules · one database

Every industry, as a row of configuration

This is the part that makes "any trade" a fact rather than a claim. A trade is **not** a fork of the software, a branch, or a bespoke build. It is a file: what this trade calls things, the stages its work moves through, the extra fields its records need, the documents it issues, which discretionary rules apply, and the reference data it starts with.

Rank	Pack	Sector	Its words for customer · order · worker	Pipelines	Documents
1	manufacturing	Manufacturing	buyer · sales order · operator	2	4
2	wholesale-distribution	Distribution	dealer · sales order · salesman	2	5
3	retail-ecommerce	Retail	shopper · order · associate	2	4
4	professional-services	Services	client · matter · fee-earner	1	4
5	healthcare-clinic	Healthcare	patient · appointment · clinician	2	4
6	logistics-3pl	Logistics	shipper · consignment · driver	2	5
7	hospitality-food	Hospitality	guest · ticket · crew member	2	5
8	education	Education	learner · enrolment · faculty member	2	6
9	construction	Construction	client · contract · site worker	2	6
10	field-service	Field service	customer · job · technician	2	5

The order is not taste. Manufacturing is the largest ERP user base — around a fifth of all users and roughly a third of market revenue. Professional and financial services is next at 13.86%, and has no stock at all, which makes it the hardest case for the claim. Distribution is 9.90%. Retail and e-commerce is the largest warehouse-management segment at about 28%. Healthcare is under 5% of ERP users today and the fastest-growing of them all at 22.37% a year. Transportation is the most-served market among third-party logistics providers at 90%, and **order management ranks first** among the technology services those providers offer.

What a pack may never do. A configuration file that can do anything is not configuration, it is a hole. A pack may not contain executable code at any depth, invent a concept the engine does not have, add a field to a table that does not exist, declare money as anything but integer paise, switch off an immutable rule — company scoping, the audit trail, the posting rules, group elimination, roster privacy — or be applied in part. Each of those refusals is a named test.

One default worth stating on its own: a rule a pack never mentions is **on**. The rulebook is the default and a pack is an exception list, never a permission list. The other way round, every rule added after a pack was written would silently apply to nobody using it.

The test that decides whether this is a product. `core/tests/packs.test.js` invents a **commercial laundry** — a trade that appears nowhere in this software, in no pack, in no module and in no rule — hands the engine a JSON string while the tests are running, and requires the whole system to answer in that trade's words: an order

reads as a docket, a work order as a wash load, a customer as an account. Its pipeline resolves ordered and terminating, its fields land on real tables, its rule switches resolve against the real rulebook, and it is refused the audit trail exactly as the shipped packs are. A final assertion fails the build if the engine file ever contains a single trade word — because an engine that knows one trade's words has an opinion about which trades are normal.

And the product screens are drawn from 12 sectors, not one: Drone & precision manufacturer, Freight forwarder, HVAC service firm, Law practice, Restaurant group, Interior contractor, Homeware brand · D2C, Precision components maker, Multi-doctor clinic, Training institute, Creative agency, Dairy co-operative. The same module is shown with each of their figures, one under the other, so the argument is made where it can be checked rather than believed.

How you actually use it — a walkthrough

The sections above say what Medhava is. This one follows a person through it, because "31 modules over one shared data core" is a true sentence that tells you nothing about your Tuesday.

Every screen below is a real render of the software, not an artist's impression — the same markup and the same stylesheet the product uses. The figures on them are illustrative.

Day one — from signing up to working, without a consultant

Nothing is blank when you arrive. Pick manufacturing and the system says sales order; pick professional services and the same screen says matter; pick the clinic pack and it says appointment. Same columns underneath, every time.

A day in the life — one order, followed all the way

An order arrives · Module 15

It lands in one queue with every other channel's orders, sorted by the time **left** on its cut-off rather than the time it arrived. The order that must leave in forty minutes is above the one that came in first and has all day.

Order queue · 9 channels · dispatch cut-off running — illustrative figures

Stock moves — everywhere at once · Module 03

One number per SKU. The unit that just sold disappears from every other channel in the same instant, which is the only way to stop the cancellation that costs you a seller rating.

Drone & precision manufacturer · Product record · one product, every channel's name for it — illustrative figures

It gets picked and packed · Module 10

A pick list in walking order, confirmed against the bin it came from. A short pick stops the pack rather than quietly reducing the order — because an order silently shipped short is a claim you will pay for later.

Drone & precision manufacturer · Pick wave 22 · Zone A → C — illustrative figures

It ships, and the money is chased · Module 11

The courier rate is checked against the packed weight before booking, and cash collected at the door stays a receivable until it is actually remitted to your bank.

Drone & precision manufacturer · Handover · what went out against what they took — illustrative figures

The books post themselves · Module 12

Revenue and tax go through one posting engine. Entries balance or they do not post — there is no third option, and no month-end scramble to find out which.

The same day, in three trades that have nothing in common

This is the whole argument, and it is easier to see than to read:

A law practice runs matters · Module 20

Same record, same columns, same ledger underneath. A matter instead of an order, a fee-earner instead of an operator, hours instead of units.

Law practice · Live matters · a practice, not a production line — illustrative figures

A clinic runs appointments · Module 19

A patient instead of a customer, an appointment instead of an order, a clinician instead of a salesman.

Multi-doctor clinic · Local search · what patients actually search — illustrative figures

A restaurant group watches its cash · Module 13

Four sites, one cash position, fourteen days ahead. No stock module was removed and no code was forked to make any of these three work.

Month end

Then the next month opens, and nothing about the close depended on anybody remembering to run it.

Every module and every app

Listed in build order. is described as finished that is not.

Module 01 · Platform

The spine every module runs on.

Not a module you open — the layer underneath all 31. Who can see what, how the system is configured, and a record of everything that ever happened. Foundation first: nothing downstream can be built before identity, roles and the audit trail exist.

Roles and permissions · who may do what — illustrative figures

Reads from: Every module **Writes to:** Every module

App	What it does
Identity, Settings & Audit	Users, roles and permissions, company switching, tax and numbering setup — and an immutable record of everything that ever happened.
Industry Packs	What your trade calls things, the stages your work moves through, the extra fields your records need, the documents you issue and the reference data you start with — all of it loaded as a row of configuration, never as a separate version of the software. Pick the pack that matches your trade and the whole system changes its words: the same order screen reads as a job, a matter, a consignment or an appointment, with the same columns underneath. A pack may rename what exists, add fields to tables that exist, and switch discretionary rules off; it may never invent a concept, add a field to a table that does not exist, contain any executable code, or switch off the guarantees — company scoping, the audit trail, money never being a float — because a trade may change its vocabulary and may not opt out of the things the books are trusted for. Adding a trade nobody anticipated is therefore a file somebody writes, not a release somebody ships.
Ask & Print	Ask from your phone, anywhere: a ledger, a bill, today's packing slips. It comes back as a PDF — or prints on the office printer, with nothing plugged into your phone.
Communications	WhatsApp commands and broadcasts, email and SMS, and the handful of scheduled jobs that carry a nudge to the right person without anyone remembering to send it. Every capability here has more than one interchangeable provider — none of them is ever the source of a figure the business reports.
WhatsApp Command Console	The shop floor does not open a laptop. A worker or a staff member sends a short message — in, out, today's pieces, leave, an advance — and it becomes a real record: attendance with the time and place it was marked, a production report against the design, a request in the approvals queue. The end-of-day prompt asks what is still open and how long it needs, so tomorrow starts from what is actually pending rather than from memory. Marking attendance checks the phone is at the unit within the radius set for it, with a grace window; a person outside it is not refused, they are flagged for the manager, because a system that locks someone out of being paid for being early at the wrong gate has failed at its job. Every override is recorded with who made it. The words a worker types are in the language they speak, and nothing here ever asks for a password, a bank detail or a document number.
Data Privacy & Consent	What a person's data may be used for, captured as consent at the point it is given and honoured everywhere downstream — including the right to have it corrected or removed. Retention (how long a record is kept) and deletion (a person's right to have their own data removed) are two different policies, tracked separately, because a rule that keeps records for the law and a request from a person to be forgotten do not resolve the same way.
Provider Router & Cost Guard	The rule that no capability depends on one outside service, enforced at the moment it matters instead of merely promised. Every capability has an ordered fallback list ending on an option that needs nothing connected, so a courier API that stops answering at 9pm, or an AI key that hits its quota mid-catalogue, drops to the next option instead of stopping the work. A provider that keeps failing is tripped out of the list entirely and retried once after a cooldown rather than hammered; retries inside one provider wait twice as long each time. And every paid call is counted in paise against a ceiling you set — over the ceiling the paid provider is refused, not warned about, and the work completes on a free one. Because every capability is guaranteed a built-in or by-hand option, a spent budget can stop the spending without ever stopping the business.
Payment Data Scope	A written statement of exactly which systems ever see a card or bank credential, and which never do — because every card-capable screen in this system hands that moment to a payment provider's own secured field and never stores or even passes the number through application code. The statement is what an auditor or a partner asks for before they will connect to this system.

App	What it does
Appearance & Localisation	The two settings a person notices in the first minute and nobody writes a specification for: which time zone a screen shows its dates in, and whether it is drawn light or dark. Time zone is the one that matters for correctness rather than comfort — every timestamp in this system is stored as an absolute moment, so a business working across two zones reads the same event at the right local time in both, and a working day that ends at midnight ends at midnight where the work happened.

Module 02 · Design & Sampling

A style exists on paper before it exists as stock.

A product moves from a first idea to something the business can actually make and sell — specification, sample rounds, costed trials and sign-off — before it is ever entered as a catalog record. Building this first means Inventory & Catalog never has to invent a style it has no real specification for.

Precision components maker · Part development · revision 4 · awaiting sign-off — illustrative figures

Reads from: CRM **Writes to:** Inventory & Catalog · Manufacturing

App	What it does
PLM & Development	First idea to something you can actually make: specification, sample rounds, costed trials and sign-off, with every version kept. A product, a machined part, a formulation or a service package all move through stages you set yourself.
Design / IP Register	What protects a design once it exists — trademark or copyright status, the date it was first shown, and a flag the moment a near-identical listing turns up elsewhere. Every version already kept by PLM & Development gets a filed status here instead of just a date stamp, because a design with no ownership record on file is a design nobody can defend.

Module 03 · Inventory & Catalog

One number everyone trusts.

The most important number in the system: one quantity per SKU, per location, per stage — read and written by every other module. And one product record that every channel lists from.

Module 04 · CRM

Know every customer completely — and answer them fast.

One record per customer carrying every lead, order, return, document and conversation, whichever channel it came from. Whoever picks up the next question can already see everything that came before it.

Drone & precision manufacturer · Customer 360 · Skyward Robotics Pvt Ltd — illustrative figures

Reads from: Every module **Writes to:** Sales · E-commerce / OMS · Marketing

App	What it does
CRM & Customer 360	Lead to won, then the full lifetime: orders, returns, value and what to offer next.
Documents & eSign	Every agreement, receipt, certificate and scan filed against the record it belongs to — an order, a party, a case, an employee — so it is found by that record instead of by remembering a folder. Send one out for signature and the signed copy files itself back.
Helpdesk & Live Chat	Questions arriving by chat, email or phone become tickets tied to the order or the account they are about, with the whole history already on the screen.
Forms & Feedback (NPS)	A short form after delivery, and the score it produces attached to the design or item it is actually about — not just the buyer — so a complaint-prone item surfaces as a pattern instead of a scatter of individual gripes.
Territories	Dividing customers and targets by region or by team, and reporting against that division. Worth having the moment there is a sales team large enough to divide and an argument about whose account something was; pointless before that. A territory is a row like anything else here, so redrawing the map is an edit rather than a migration, and last year's figures stay readable against last year's boundaries instead of being silently restated under the new ones.

Module 05 · Sales

Every way you sell, one order book — to the doorstep.

Retail counter, wholesale, export and your own website all write to the same order and draw on the same stock number. The courier side lives here too, so a sale is not finished when it is billed — it is finished when it is delivered and the COD money is in.

Drone & precision manufacturer · Order book · every channel, one list — illustrative figures

Reads from: Inventory & Catalog · CRM · Warehouse · Logistics **Writes to:** Inventory & Catalog · Accounting & GST · Warehouse · Logistics

App	What it does
D2C Sales	Orders from your own storefront — hosted, self-hosted or custom — cart to dispatch, with loyalty and partial COD.
B2B & Credit	Wholesale orders with credit limits, tier pricing and outstanding ageing.
Export	Commercial invoice, packing list, LUT bond and IGST-refund tracking.
POS	Counter billing that draws on the same stock as your website.
Quotes & Proforma	Send a quote, convert it to a confirmed order in one click.
Couriers & AWB	Book the shipment on the order itself, compare couriers, print the label and follow the AWB to the door.
Subscriptions	A schedule that raises its own invoice on its cycle and follows up on its own when a payment fails — for anything sold as a standing order rather than a one-off.
Customisation & Made-to-Measure	The order that does not exist in the catalogue: a buyer sends reference pictures and their own measurements, a price is agreed over several messages, and the piece is made for them. All of it is one record — the references, the measurement set, every quote in the negotiation and what was finally agreed, the advance taken to start work and the balance taken before dispatch. When the order is accepted it opens a production order like any other, so a bespoke piece is costed, made, checked and posted exactly as a catalogue piece is. Two legs of money on one order is the part most systems get wrong: the advance is earned when the work starts, the balance is owed until the piece ships, and the ledger shows both separately rather than one payment appearing when the whole thing is over.
Appointment Booking	A slot a customer books for themselves — a fitting, a consultation, a service visit — against the real availability of whoever or whatever is needed for it. It writes to the same Calendar the rest of the business works from, so a booking taken on a website at midnight cannot collide with something already in the diary.

Module 06 · Planning & Requirements (MRP)

Turn what is selling into what to buy and make.

Confirmed orders and demand history have to become a plan before Purchase can buy anything or Manufacturing can start anything — otherwise buying and making are both just guessing. This module sits between the two: it reads what is actually selling and what is already committed, and turns that into requirement, not the other way around.

Precision components maker · Requirement run · week 34 · what to order — illustrative figures

Reads from: Sales · E-commerce / OMS · Inventory & Catalog **Writes to:** Purchase · Manufacturing

App	What it does
Demand Forecast & Signal	What sold, by SKU and by period, turned into a short-term forecast — the number every requisition and every production order downstream is measured against instead of a guess.
Requirement Explosion (MRP run)	Confirmed demand exploded through the bill of materials into what raw material to buy and what to produce, and by when — so a purchase requisition or a production order always traces back to real demand, never to a feeling that stock is getting low.
Open-to-Buy / Budget Ceiling	A spending ceiling set per period regardless of what the demand signal suggests, so a real signal cannot on its own commit more money than the business has decided to risk this season. Every requisition the MRP run drafts is checked against what is left of the ceiling before it goes to Purchase.

Module 07 · Purchase

Nothing over-billed gets paid.

The buy side end to end — and the control that stops you paying for goods you rejected.

Precision components maker · Three-way match · nothing over-billed is paid — illustrative figures

Reads from: Inventory & Catalog · Planning & Requirements (MRP) · Manufacturing **Writes to:** Inventory & Catalog · Accounting & GST · Quality & Compliance

App	What it does
Procurement	RFQ to purchase order to goods receipt, with a strict three-way match before any bill is paid.
Vendor Management	Vendor 360, payables, ageing, a real risk score, and sourcing that follows performance.
Insurance Register	What cover exists over stock in transit, stock in the warehouse and product liability, matched against what is actually moving through Purchase and Warehouse right now — so real value in transit is never quietly running with no cover tracked anywhere.

Module 08 · Manufacturing

Know what a unit really costs to make.

From material in the door to the finished unit — including what every worker earned and what each product actually cost. You define the stages, the rates and the rules; nothing here is fixed to one trade. Design and sample sign-off happen upstream now, and quality inspection and the compliance record live in their own module downstream — this module is purely the making.

Precision components maker · Work in progress · your own stages — illustrative figures

Reads from: Purchase · Planning & Requirements (MRP) · Design & Sampling **Writes to:** Inventory & Catalog · HR & Payroll · Accounting & GST · Quality & Compliance

App	What it does
Production Orders	Your own stages from first operation to finished goods, with work-in-progress visible at each one.
Piece-rate & Contractors	Output-based pay for anyone paid by the piece rather than the hour — pooled completion, per-unit rates, rework and advances resolved into a single payout.
BOM & Consumption	What each product consumes, costed at today's material rates.
Maintenance	Machines, tools and assets: what is due for service, when it was last done, what it cost, and what stopped while it was down. Planned and breakdown work against the same asset record.

Module 09 · Quality & Compliance

Certify what was received and what was made.

Quality inspection used to live buried as one step inside Manufacturing; it stands on its own here because a rejection at goods-receipt and a rejection on the production floor are the same discipline, and because the certificates a business holds — the proof it follows a standard — belong next to the inspections that back them up, not scattered across email.

Precision components maker · Inspection · lot 8841 · first article — illustrative figures

Reads from: Purchase · Manufacturing **Writes to:** Purchase · Manufacturing · Inventory & Catalog

App	What it does
Quality Control	Accept, reject or rework — on goods received and on goods made — with reasons that feed the supplier scorecard and the performance flags alike.
Certificate & Compliance Register	Every standard the business or a vendor holds — a safety, labour or environmental certification — with its issue date, its expiry, and the audit that backs it, so a certificate about to lapse is visible before a buyer asks for it and finds it already expired. What this register tracks is what a sustainability report downstream is actually built from.

Module 10 · Warehouse

Pick right the first time — and prove what you sent.

Bin-level instructions and barcode scanning, so the right item leaves the building and stock stays honest — and a recording of each parcel being packed, so an argument about what was in it is settled by footage instead of by memory.

Drone & precision manufacturer · Pick wave 22 · Zone A → C — illustrative figures

Reads from: Sales · E-commerce / OMS · Inventory & Catalog **Writes to:** Inventory & Catalog · Sales · E-commerce / OMS

App	What it does
Picking & Bins	Pick lists that tell staff exactly which bin to walk to, in walking order.
Barcode Operations	Scan to pick, pack, dispatch and run a physical stock count from a phone — the same scan whether the order came from a marketplace, your storefront site or the counter.
Packing Video	Every parcel recorded as it is packed and indexed by its order number, so a wrong-item claim is answered with the clip. The footage attaches itself to the claim that needs it.

Module 11 · Logistics

The courier network itself — rates, failures and the COD money.

Booking one parcel happens on the order, in Sales. This module is the network behind it: what every courier charges before you pick one, what happens to a delivery that fails, and whether the cash collected at the door actually reached your bank.

Drone & precision manufacturer · Handover · what went out against what they took — illustrative figures

Reads from: Sales · E-commerce / OMS · Warehouse **Writes to:** Accounting & GST · Sales · E-commerce / OMS

App	What it does
Rates & Zones	Every courier's rate card by zone, weight slab and service — so the cheapest and the fastest option for this parcel are both known before it is booked.
NDR & RTO Rescue	A failed delivery worked while it can still be saved — reattempt, call, correct the address — before it becomes a return you pay for twice.
COD Remittance	What the courier collected at the door against what reached your bank, parcel by parcel, with every shortfall named and aged.
Handover & Manifest	What is expected out today against what the courier actually took, counted per courier and per service. The manifest to hand over, the one-time code to confirm it, and a signed record of the parcels that were left behind — so a parcel lost between your table and their van has an owner.
Fleet	Your own delivery vehicles, if you run any — what each trip cost, what is due for service, and what that adds to freight. Optional; most businesses run couriers only.

Module 12 · Accounting & GST

Books that always balance.

A full double-entry ledger built for Indian compliance — not a tax report bolted onto a spreadsheet. Medhava keeps the books on its own: no other accounting package is required, ever.

Drone & precision manufacturer · Trial balance · it always ties — illustrative figures

Reads from: Every module **Writes to:** Finance Reports · Treasury & Financial Planning

App	What it does
Accounting	Double-entry books where every voucher balances and the trial balance always ties.
Invoicing	GST tax invoices and receipts, totals computed from the lines to the paise. Where a channel raises its own invoice, both numbers live on the order — theirs and yours — so the panel's paperwork and your books point at the same sale and neither has to be re-keyed to find the other.
Expenses	Spend captured by category with approvals, and bill OCR to save typing.
GST & Tax	CGST, SGST, IGST, TDS, TCS, input credit, GSTR-1 and GSTR-3B — filed per registration, so a group where one company is registered and another is not files exactly what each one owes and nothing it does not.
ITC Reconciliation	Every input credit matched against the government's own GSTR-2A/2B before a return is filed, so a credit claimed is a credit that is actually on record.
Receivables, Payables & PDC	Payments and receipts allocated against named open invoices, and a register for post-dated cheques that posts only on the date they are realised, not the date they were written.
Fixed Assets & Depreciation	The asset register with both Straight-Line and Written-Down-Value depreciation tracked side by side, and disposal posting its gain or loss straight to the books.
Year-End Close & Period Lock	Profit-and-loss accounts reset and balance-sheet accounts carry forward at year end, and a reviewed period locks against backdated edits until an admin unlocks it — an act that is itself logged.
Finance Reports	P&L, balance sheet, and profit by channel, product and SKU.

Module 13 · Treasury & Financial Planning

Know what cash is coming, not just what already arrived.

Accounting records what happened; this module is concerned with what happens next — how much cash is actually expected, when, and whether spend against a budget is on track before the month closes and turns the answer into history.

Restaurant group · Cash position · four sites · next 14 days — illustrative figures

Reads from: Accounting & GST · Sales · Purchase **Writes to:** Accounting & GST

App	What it does
Cash Flow Forecast	Expected receipts and expected payments laid out by week, drawn from open invoices and open bills rather than typed in by hand — so a cash shortfall is visible weeks before the date it would actually bite.
Banking & Reconciliation	Bank statement lines matched against the ledger’s own record of what should have moved, with anything unmatched surfaced instead of silently carried forward.
Budget vs Actual	A budget set per category and period, and actual spend from Accounting tracked against it as the period runs — not only after it closes, when the only thing left to do is explain the variance.

Module 14 · Settlement

Get paid what you are owed — cycle by cycle.

Matching one payout to one order line happens in OMS. This module is the level above it: the settlement cycles each panel runs, the fees it actually charged against the fees it published, and the tax it deducted on your behalf.

Settlement cycles · what each channel really paid — illustrative figures

Reads from: E-commerce / OMS · Accounting & GST **Writes to:** Accounting & GST

App	What it does
Payout Cycles	Every settlement cycle each panel runs — what it should pay, what actually landed in the bank, and on which day — so a late payout is visible the day it is late, not at month end.
Fee & Commission Audit	The rate card a channel publishes against the rate it actually charged, category by category and SKU by SKU. A silent commission increase is caught the first time it is applied — and the tier you are rated in is on the same screen, because the tier is what the rate card hangs off, and losing one quietly costs more than any single deduction.
TCS & TDS Register	Every rupee the panels deducted as TCS and TDS, matched against the portal's own figures — so the credit you claim is the credit you are actually owed.

Module 15 · E-commerce / OMS

Every marketplace and your own website, one queue.

Stop logging into seven seller panels and your own store admin. Every order — Amazon, Flipkart, Meesho, Ajio, Nykaa, JioMart, Myntra, and your own storefront, a self-hosted storefront platform or custom site — lands in one pipeline, and one stock number goes back out to all of them. Then the money side closes in the same module: what each channel paid, what it kept, what came back, and what you are still owed.

Order queue · 9 channels · dispatch cut-off running — illustrative figures

Reads from: Inventory & Catalog · CRM · Sales · Accounting & GST · Logistics · Settlement **Writes to:** Inventory & Catalog · Accounting & GST · Warehouse · Logistics · Settlement

App	What it does
Marketplace OMS	Every marketplace and every storefront in one order queue — Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa and JioMart alongside any hosted, self-hosted or custom storefront. The stages each channel really uses — to accept, to pack, ready to dispatch, handed over, in transit — with the right cut-off counting down on every order, because a quick-commerce or air-shipped order is not due at the same hour as a standard one. Priority orders first, the day grouped by product so one item is picked once instead of once per parcel.
Order Management	One pipeline from new to delivered, whether the order came from a seller panel, your own storefront site, a dealer or the counter.
Manual Data Check	Upload the sheets you already download — marketplace orders and returns, and your own counter-shop registers, one file or a whole ZIP — and read ten cross-checks back: money, month, item, state, returns, claims, ads, payouts and GST. Every figure is clickable down to the transactions behind it, and the whole result downloads as Excel.
Reconciliation	Match every marketplace payout to the order line that earned it, and expose the gap.
Claims & Disputes	Turn shortfalls, weight disputes and lost parcels into filed claims with evidence — and answer them before the clock runs out. A claim that is awaiting your response is worth money; one closed for no response is worth nothing, so the days remaining sit on the screen next to the amount.
Returns / RMA	Customer, courier and wrong returns — and the dead stock they actually cost you.
Channels & Storefronts	Connect a channel once and it stays in step: catalogue out, price out, stock out, orders in. Seven marketplaces and any website platform — any hosted, self-hosted or custom site over its own API — each switchable without touching your data. Shopsy and any other storefront a channel runs alongside its main one counts as its own channel here. Where a channel has no open interface, its own downloaded report is a first-class way in. A channel may also know you by a different trading name — that is a label on the channel, not a second company, so it tags the order and the payout without ever splitting your books.
Labels & Documents	The channel gives you a PDF; this turns it into something a packer can work from. Cropped to your label size, your own product code printed large where the channel left it off, the invoice and the packing slip merged behind it, and the whole batch sent to the label printer in one job. Reprint a single parcel without redoing the batch — and nothing is ever uploaded to an outside website to be cropped.
Listing & Catalog Manager	Bulk-create and bulk-edit listings across every channel from the one product record in Inventory & Catalog, and catch the mismatches that quietly cost sales: listed but out of stock, or in stock but never listed.
Size / Fit Recommendation AI	A fit suggestion at the point of purchase, built from the item's own measurements and the return history of buyers who picked each size — aimed straight at the return reason that costs the most: the right item in the wrong size.
AR / Virtual Try-On	A way to see drape, fit and colour on a screen before buying, for items where a flat photo alone leaves too much to guess.

Module 16 · HR & Payroll

Pay people right, on time.

Salaries and output-based earnings in one register, with attendance driving both — whether people are on a monthly wage, an hourly rate or paid by what they finish.

Precision components maker · This month's register · staff and contractors — illustrative figures

Reads from: Manufacturing **Writes to:** Accounting & GST

App	What it does
Staff & Contractors	Attendance, effective-dated salary and output-based earnings in a single register, whoever is on it.
Time-off & Advances	Leave, festival advances, and exactly how they change this month's payout.
Appraisal & Hiring	Performance reviews and a hiring pipeline that ends in an employee record.
Recruitment	The pipeline before someone becomes an employee — an opening, the people who applied for it, a trial piece where the work itself is the interview, and the decision with its reason kept. It matters more in a skilled trade than in most: a person is taken on for skill at one particular kind of work, and the trial output is the evidence, so it is recorded against that work and the rate that would apply rather than remembered as an impression. A candidate who is not taken on now stays findable when the same skill is needed in a busy month, and their personal documents are held under the same consent and retention rules as anyone else's, not in a folder on somebody's phone.
Payout Execution	Where the calculation in the earnings register actually turns into money leaving the business — bank batch, UPI, cash against a signed receipt — with the method and the reference recorded against every payout, so the register's total and the money that actually moved can always be checked against each other.
Employee Engagement & Surveys	Asking the people who work here how it is going, and keeping the answers where a pattern can be seen rather than in one manager's memory. Anonymity has to be real to be worth anything: a survey that quietly identifies its respondents produces polite answers and no information, so where a response is promised anonymous it is stored unlinked from the person, and the system cannot re-join them afterwards even for an administrator.

Module 17 · Marketing

Sell more without discounting.

Plan content, run campaigns, and let rules keep your prices competitive while protecting margin.

Campaigns measured on revenue, not opens — illustrative figures

Reads from: Inventory & Catalog · CRM **Writes to:** Sales · E-commerce / OMS

App	What it does
Social Calendar	Plan and publish across every channel from one calendar.
Campaigns	Email, SMS and WhatsApp campaigns measured on real revenue, not opens.
Repricing Engine	Rules per channel and SKU — floor, ceiling, match-lowest, festival overrides — and what each change actually did. A price that went up and took the orders down with it shows as exactly that, next to the rule that raised it, so the rule can be reversed on evidence rather than on a feeling.
Automation	If this happens, do that — across any module, without writing code.
Blog & Pages	Articles, landing pages and category copy written, scheduled and published straight to your own site — any hosted, self-hosted or custom storefront — with the meta title, description and internal links set before it goes out.
Events	Trade shows and exhibitions worked as a channel of their own — booth, budget and every lead captured on the floor landing straight in CRM instead of on a stack of business cards.
Website & Page Builder	The storefront itself, built by dragging sections into place rather than by editing a theme file — hero, product grid, size guide, lookbook, contact form — each block reading live from the catalogue, so a price or a stock state on a landing page is the same number the order screen uses instead of a figure someone pasted in and forgot. Blog & Pages above writes articles into a site that already exists; this is for the businesses that do not have one, and it is the gap that shows up plainly when this module list is set beside a mature open-source ERP: they ship a full site builder next to the blog, and until now this did not.
Markdown / Clearance Optimization	The same rule engine that reprices for competitiveness, aimed at ageing stock instead: when to start discounting it and by how much, before it becomes a warehouse write-off rather than a sale at a lower margin.
Social Engagement & Inbox	The replies, comments and messages that arrive on the accounts the business posts from, in one queue rather than four apps on somebody's phone. Distinct from the Social Calendar, which decides what goes out: this is what comes back, and it is where a complaint first appears in public. A message here can become a Helpdesk ticket with the thread already attached, so a public question and a private one end up in the same place.

Module 18 · AI Content Engine

Write it, shoot it, cut it — from the catalogue you already have.

Listings, ads, email, product photography and reels, all generated from your own catalogue — so the words match the product and the picture is the right size for the channel it is going to. Words, images and video sit in one module because they are one job.

Content pipeline · written from your own catalogue — illustrative figures

Reads from: Inventory & Catalog **Writes to:** Marketing · E-commerce / OMS

App	What it does
Content Engine	Fourteen stages in your own voice, from buyer research and competitor reading through hooks, channel-ready listings, ads, social posts, video scripts, song lyrics, the publishing calendar and alt text — each written from your own catalogue, so the words match the thing.
Image Studio	Layers, free transform, background removal, channel presets and SEO alt text — a phone photo becomes a channel-compliant product image.
Video Studio	Text and image to video, reels and ad cuts sized for every channel.
Design Studio	A full design surface — templates, layers, undo and redo, any colour, exact sizing, background images and stock elements — exporting PNG, JPG or PDF at whatever size the channel or the printer asks for.
Motion Renderer	A reel rendered from a page of HTML and CSS — the same layers, fonts and brand colours the Design Studio already uses — into a real MP4, on this machine, with nothing uploaded. It is not a screen recording: the clock is faked, the animation is seeked to the exact instant of each frame, and only then is that frame captured, so the render does not care whether the machine was busy. Rendering the same festival banner twice produces the same file to the byte, which is what makes a reel something you can check and re-cut rather than something you have to watch all the way through and hope about.
Narration Studio	A voice over the reel, in the language the buyer actually speaks — the same script the Content Engine wrote, spoken. The default needs nothing installed and no key, because every modern browser can already speak; a self-hosted or cloud voice sits behind it as an interchangeable provider for anyone who wants a cloned or branded one. Long scripts are split at sentence boundaries and rejoined, so a two-minute description is not cut off at whatever limit a service imposes. A voice cloned from a real person is only ever used with that person's recorded consent, filed against them in Data Privacy & Consent like any other permission.
Image Generation Slot	Generated imagery — a model on a background you do not have to shoot, a festival backdrop, a lifestyle scene — as a capability with interchangeable providers rather than a bet on one service: a queue of jobs, a preview while it works, inpainting to fix one region, upscaling and face correction. This one needs a graphics card. Image models cannot run on an ordinary office machine or on the container this system is built in, so what ships is the queue, the review screen and the provider slot, with the generating itself done by whichever engine you point it at — your own GPU box, or a cloud service, swapped without touching anything else. Said plainly here because the alternative is a screen that looks finished and produces nothing.
Publisher	One push sends the finished listing, picture and copy everywhere it has to appear — your storefront, each marketplace, each social account — and reports back what actually went live and what was rejected, with the reason.

Module 19 · SEO, AEO & AIO

Be found by a search box, an answer box and an AI.

Content already exists once this module is reached; here it is made findable — by a traditional search engine, by the answer box above the results, and by the AI assistants now answering shopping questions directly instead of sending someone to a results page.

Multi-doctor clinic · Local search · what patients actually search — illustrative figures

Reads from: Inventory & Catalog · AI Content Engine **Writes to:** Marketing

App	What it does
Technical SEO & Schema	Structured data, sitemaps and page-level technical checks against your own storefront and content pages, so a search engine can read what a page is actually about instead of guessing from the text alone.
Answer-Engine Optimization	Content shaped to be quoted directly by an answer box or a voice assistant — a clear, citable answer near the top of the page — rather than written only for a person to scroll through.
AI-Engine Visibility Tracking	Whether and how this business is actually cited when someone asks an AI assistant a shopping question in this category, tracked over time — the same discipline as rank tracking, aimed at a newer kind of result page.

Module 20 · Projects & Collaboration

The work that is not an order — and the talking around it.

Not every business runs on orders. A law firm runs on cases, an agency on engagements, a workshop on jobs, a builder on sites. This module holds that work on the same records as everything else, so the time, the cost, the documents and the decisions attached to it end up in the books rather than in somebody's inbox.

Law practice · Live matters · a practice, not a production line — illustrative figures

Reads from: CRM · Sales · HR & Payroll · Inventory & Catalog **Writes to:** Accounting & GST · HR & Payroll · CRM

App	What it does
Projects & Cases	A project, a case file, an engagement or a job — whatever your work is called. Stages you define, owners, deadlines, documents, billable time and real cost, all on one record the ledger can see.
Timesheets & Planning	Who is on what this week, and the hours that actually went in — against a project, a case, a job or a machine. Billable and non-billable separated, so a rate card turns straight into an invoice and a real cost.
Approvals	One queue for everything waiting on a yes — a purchase order, a discount, a leave day, a credit note, a payment. The rule that sent it there is on the screen next to it, and the decision goes to the audit record.
Forum	Questions and answers that outlive a chat — for customers, dealers or staff — with the useful ones kept where the next person will actually find them.
Automation Studio	The place a person builds “when this happens, do that” by dragging it out and watching it run — a trigger, the steps after it, a branch where the answer decides which way to go — over the same event stream every module already writes to. Marketing’s Automation aims that idea at campaigns; this is the general one, reaching any module: a payment marked short holds the next dispatch and opens a claim, a worker’s pooled output crossing a threshold raises the payout for approval, a return marked damaged writes off the piece and messages the buyer. Every run is kept — what fired it, each step, what each step returned — because an automation nobody can inspect afterwards is a rule the business cannot trust with its money.
Discuss	Conversation attached to the record it is about: this order, this bill, this case. A year later the reason for a decision is still sitting next to the decision.
Knowledge Base	A searchable internal wiki of standard operating procedures, scoped to the role it applies to, so how a task is meant to be done is written down once instead of carried in one person’s head.

Module 21 · Dashboard & BI

See the whole business without asking anyone.

Every number in Medhava rolls up here as work happens — no exports, no waiting for month-end, no asking three people for their sheet. It is the last module built for a reason: it has nothing to show until the other twenty are producing real records for it to read.

Group dashboard · All companies · FY 2026-27 — illustrative figures

Reads from: Every module **Writes to:** —

App	What it does
CEO Dashboard	Cash, sales, stock, profit and alerts on one screen, refreshed as work happens.
Report Builder	Drag the fields you want into a report and save it for the whole team.
Group Consolidation	Several companies, one set of figures — sales, cash, stock and profit rolled up across every company you run, inter-company entries removed, with years of history to compare against. Add a company whenever the business grows one; nothing in the software caps the number, only the plan does. And a company with no tax registration of its own — a job-work arm, a new venture not yet registered — is a company like any other here, kept in the group figures without being dragged into a return it does not belong in.
Excel Dashboard Builder	A full workbook — financial summary, HR, purchase, sales, inventory and production, GST, expenses — generated from the live records behind every other screen, with each company shown as its own row and a consolidated row that is a formula over them, never a separately typed total.
ESG / Sustainability Reporting	Water usage, chemical compliance, waste and packaging, reported from the same certificate and audit records Quality & Compliance already keeps — so a sustainability report is a query over evidence already on file, not a separate exercise assembled once a year from scratch.
Data Warehouse	Somewhere shaped for asking questions rather than for recording transactions. Honestly premature: a warehouse is what a business builds when queries against the live records start hurting, and nothing here has ever run at a volume that could hurt. It is named so the specification has a home for it, and ranked as what it is.
Pipelines & Enrichment	The scheduled movement of data into that shape, and the step that fills in what a record was missing from somewhere else. Enrichment is the part that needs care: a field filled in from an outside source has to stay visibly different from one the business entered itself, or a guess quietly becomes a fact in next quarter's report.
Maps & Geospatial Views	Figures drawn on a map instead of in a column, for the questions that are actually about geography — where the orders come from, where the returns concentrate, which routes cost what. One visualisation type among many, listed separately in the specification and kept separate here because it needs location on the records before it can show anything at all.
Embedded Analytics	A report placed inside another screen, or inside somebody else's system, rather than opened from the reports list. It reads through the same permissions as everything else, so an embedded view can never show a viewer more than they could have seen by opening the report directly — which is the mistake that makes embedding dangerous when it is bolted on afterwards.

Module 22 · AI Assistant, Agents & Automation

Ask the business a question — and let the routine work run itself.

Last for the same reason Dashboard & BI is late: something that answers questions about the whole business can only be built once the whole business is in one place. Three different things live here and the difference between them matters. An ASSISTANT answers a question you asked, from the records, with the records attached. A CHATBOT holds the same conversation with your customer instead of you. An AGENT is given a job rather than a question and works out the steps itself. That last one is what separates this module from Automation Studio in Module 20, where a person draws the steps in advance and the rule runs the same way every time; and from

Automation in Module 17, which fires marketing campaigns and nothing else. Both of those stay exactly as they are — this module sits above them and calls them, rather than replacing either. Module 18 writes content; this module answers and acts.

Agent runs · this week · every step recorded — illustrative figures

Reads from: Every module **Writes to:** Projects & Collaboration · CRM · Marketing

App	What it does
AI Assistant	Ask in your own words — “what did Myntra actually pay us last week, and what is still short?” — and get the answer with the rows it came from sitting underneath it, each one clicking through to the record. It reads the ledger, the stock table and the settlement lines the same way a report does, so the figure it gives is the figure the books give. When it cannot find the answer it says so and shows what it looked at; it never estimates a number and presents it as a fact, because a plausible wrong figure is far more expensive than an honest blank. It answers only from records the person asking is already allowed to open, so it can never become a way around permissions.
AI Chatbot	The same engine turned to face the customer, on your own storefront and on WhatsApp: where is my order, will this size fit me, I want to return this. It reads the real order and the real size chart rather than a script written six months ago, and it will say “let me get someone” instead of guessing at anything about money, a refund or a complaint. The handover goes into the Module 04 Helpdesk queue with the whole conversation already attached, so the person picking it up starts where the customer left off instead of asking them to explain again. It never asks a customer for a card number, a bank detail or a password — that promise does not get a chatbot-shaped exception.
AI Agents	A job rather than a question: “chase every unreconciled settlement line from last week and draft the claim for each.” The agent works out the steps, does them, and stops at the point where a person has to decide. It runs inside a scope you set — which records it may read, which it may write, and how much it may spend through the Module 01 Provider Router — and it cannot quietly widen that scope mid-run. Anything that moves money, files a claim, changes a price or sends a customer a message waits for a human yes.
Agent Guardrails & Run Log	What each agent is allowed to touch, written down as a scope rather than trusted to a prompt, and every run recorded step by step: what started it, what it read, what it proposed, what a person approved, what it actually changed. Kept in the same audit trail as everything else, with the same absence of an off switch. An agent whose working nobody can inspect afterwards is not a colleague, it is an unexplained entry in the books.
Knowledge & Retrieval	The index that makes the answers grounded: your own designs, rate cards, settlement files, standard procedures and past decisions, searchable so a reply quotes what is actually on file instead of what a model remembers about the trade in general. Permission-scoped at the row, so two people asking the same question get answers drawn only from what each of them may already see.
Voice In and Out	The same assistant asked out loud and answering out loud, because the people who most need a figure are often holding something in both hands. A question spoken in the language the speaker actually uses becomes the same query the typed assistant would have run, and the answer comes back as speech with the rows still attached for anyone who wants to look at them. It refuses exactly what the typed one refuses: it will not read out a figure it could not find, and it will not take a password, a card number or a bank detail by voice — a spoken channel does not get an exception to a promise the rest of the system keeps.
Corrections & What It Has Learned	When the assistant gets something wrong, the correction is a record rather than a conversation that scrolls away. Somebody says what the right answer was, that sits against the question it belongs to, and the next person asking gets the corrected version with a note of who corrected it and when. The whole list is readable and editable by the business — not a hidden memory quietly steering answers — so a correction made in haste can be found and undone. Nothing here changes the model; it changes what the model is shown, which is the only kind of learning anybody can audit afterwards.

Module 23 · Developer Platform

Let other software talk to this one — and build on it.

One decision, not twenty-five: whether anything outside this system may call it. Twenty-five lines of the specification are that single capability written out from four different places, which is why it stands as a module instead of a feature buried in Platform. A versioned surface with keys and rate limits, webhooks going out, functions running on top, and only then a builder that lets somebody assemble a screen without writing code. The order matters, because a builder over nothing is a demonstration. The sign-on model has to be settled before any of it: changing how a caller proves who it is afterwards means reissuing every credential ever handed out.

Developer platform · keys, calls and deliveries · last 24 h — illustrative figures

Reads from: Every module **Writes to:** Every module

App	What it does
API & Access Keys	A versioned surface over the records this system already keeps, with a key per caller, a rate limit per key, and a log of what each one asked for. Versioned from the first release rather than the third, because the moment an outside system depends on a response shape, changing it silently breaks somebody else's software at a time nobody chose. A key is scoped to exactly the records its holder may already read, so this can never become a way around the permissions every screen obeys.
Webhooks	The other direction: this system calling out when something happens rather than waiting to be asked. A subscription names the event and the address to post to, deliveries are signed so the receiver can tell a real call from a forged one, and a failed delivery is retried on a widening interval and then parked where somebody can see it instead of being dropped. Every attempt is recorded, because an integration that silently stopped firing is worse than one that never worked at all.
Functions & Scripting	Small pieces of logic that run inside the system — when a record changes, on a schedule, or when an automation calls them. Each runs with a time limit, a memory limit and the permissions of whoever or whatever triggered it, so a script can never read what its author could not. What a function did lands in the same audit trail as everything else.
Low-code App Builder	Assemble a screen and the record behind it by dragging fields rather than writing code, for the cases a trade needs and nobody anticipated. What it produces is a configuration row, exactly as an industry pack is, and never a separate copy of the software — so an assembled screen still obeys company scoping, the audit trail and every guarantee the rest of the system makes.
Builder Data Model	The tables and relationships a built application stands on: what a record is, which other records it points at, and which fields may not be empty. Kept separate from the builder because the data model is the expensive half to change later — a screen can be redrawn in an afternoon, a relationship that was wrong has to be migrated with all the rows already sitting in it.
App Versioning & Release	A built application has versions, somewhere to try one before it goes live, and a way back. Without this the person who assembled a screen is editing the live system at the exact moment they are still learning it, which is how a business loses a day of entries.
Developer Console	One place to see what the platform is doing for a given caller: keys issued, calls made, webhooks delivered or failed, functions run, and what each one cost. Somebody debugging an integration at two in the morning should not have to ask a person for a log.
App Marketplace	A directory of applications built on this platform that a business can install into its own company, with what each one may read and write shown before installation rather than discovered after it. Nothing installs without somebody first seeing the scope it is asking for.
Robotic Process Automation	Driving another system that offers no interface of its own by working its screens the way a person would. It is the least reliable way to connect anything, and worth having only when the alternative is somebody retyping figures every morning — so it is recorded here as a last resort with a run log proving what it actually did, never presented as equivalent to a real connection.

Module 24 · Agile & Sprints

Plan work in iterations, and see what actually got done.

Thirteen lines of the specification that amount to one board, one boundary and one chart. It sits beside Projects & Collaboration rather than inside it because a task list and a sprint are different disciplines: a task is either done or not, while a sprint asks how much a team reliably finishes in a fixed period and holds that answer against the last one. A business running a factory may never want any of this, which is precisely why it is a module that can be left switched off instead of something bolted onto the task list everybody uses.

Sprint 14 · six working days remaining — illustrative figures

Reads from: Projects & Collaboration · HR & Payroll **Writes to:** Projects & Collaboration

App	What it does
Product Backlog & Stories	The queue of work that has not been started, written as something a person wants rather than a task somebody was handed, grouped under the larger outcome it belongs to and sized relative to the others. Sizing is deliberately relative and not in hours, because the one thing teams estimate consistently is whether a piece is bigger than another piece.
Sprints & Boards	A fixed period with a set of work committed to it, and a board showing where each piece has got to. The boundary is the point: work added midway is visible as having been added midway, so the difference between what was planned and what was delivered stays legible instead of being quietly absorbed. Planning at the start and a review at the end are part of the same record, not meetings held somewhere else.
Velocity & Burndown	How much this team actually finishes per period, and how the current one is tracking against what remains. Both are read from the board rather than typed by anybody, which matters because a progress figure a person types is a figure a person can round.
Release Planning	Which finished work goes out together and when, drawn from what the sprints have actually completed rather than from what was hoped for at the start. A release date derived from delivered work is the only kind that survives contact with the second sprint.

Module 25 · Meetings

Who is invited, who came, and what was decided.

The half of meetings that is not live video: who is invited, when it is, who attended, what was decided, and a poll or a question queue while it runs. The video itself needs media servers, bandwidth and relays, which a business rents rather than builds, so it is recorded as a constraint instead of a module. Separating the two is the whole idea — the useful and durable half does not need the expensive half, and a decision nobody wrote down is lost whether or not the call was recorded.

Monthly production review · 14 invited — illustrative figures

Reads from: CRM · Calendar · HR & Payroll **Writes to:** CRM · Calendar

App	What it does
Meeting Scheduling	Proposing a time, holding the slot, and letting people say whether it works before it is fixed. It reads the same availability the Calendar module keeps, so a meeting cannot be booked into a time the system already knows is taken.
Participants, Co-hosts & Moderators	Who is invited, who may run the session, and who may quiet it down. Three separate roles rather than one, because the person who owns the meeting is often not the person who should be managing a room of forty people while also presenting to them.
Polls & Q&A	A question put to everyone with the answers counted, and a queue of questions from the floor that can be ordered by how many people want the same one asked. Both outlive the call: the result is attached to the meeting record rather than disappearing when the window closes.
Call & Meeting Analytics	The record of contact — that a call or a meeting happened, with whom, about which account, and what came out of it — filed against the customer or the project it concerned. This is the half with lasting value: six months later nobody needs the recording, they need to know what was agreed and by whom.

Module 26 · Calendar

Events, invitations and who is actually free.

Eleven lines of the specification that are genuinely one thing. Recurring events and time zones are where the real difficulty sits, and both are solved problems reached for from a library rather than reasoned about from first principles — an event repeating on the last working day of a month, moved once, in a zone that shifts its offset twice a year, is the kind of thing that must never be written by hand twice. Syncing to an outside calendar needs that provider’s credentials and is a constraint; a calendar of this system’s own is not.

Team calendar · week of 21 September — illustrative figures

Reads from: Every module **Writes to:** Meetings · Projects & Collaboration · HR & Payroll

App	What it does
Events & Recurrence	A dated entry with the people it concerns, and the rules for one that repeats. A single occurrence of a repeating event can be moved or cancelled without disturbing the rest of the series, which sounds small and is the difference between a calendar people trust and one they quietly stop using.
Invitations, Availability & Time Zones	Asking somebody to an event, tracking whether they answered, and showing when they are genuinely free. Every time is stored as an absolute moment and displayed in the reader’s own zone, so a meeting set across two countries means the same instant to both of them and survives a daylight-saving change landing between the booking and the day.
Shared & Team Calendars	A calendar belonging to a group rather than a person, with control over who may see a full entry and who may see only that the time is taken. The distinction matters: a team usually needs to know somebody is busy without being told what about.
Resource Booking	The things that get double-booked as often as people do — a room, a vehicle, a machine, a piece of equipment. Held as a bookable record with the same conflict checking an invitation gets, because a room with two meetings in it is the same failure as a person with two.

Module 27 · Mail

Sort, route and answer what arrives.

The reading and organising half of email. Hosting a mail domain is a constraint rather than a task — deliverability and sending reputation are infrastructure a business rents and earns over months — but once a mailbox exists somewhere, filtering it, routing it and answering it from one place is ordinary work. It stands apart from the Helpdesk in CRM on purpose: a ticket is a thing with an owner and a resolution, while a mailbox is a stream, and pretending the stream is a queue is how genuine questions end up closed unanswered.

Shared inbox · orders@ · this morning — illustrative figures

Reads from: CRM · Every module **Writes to:** CRM

App	What it does
Shared Inbox	One mailbox several people work, with it visible who is dealing with what so two of them do not answer the same message differently within a minute of each other. An address a business publishes belongs to the business, not to whoever happens to have the password for it.
Folders, Labels & Search	Filing, tagging and finding, including inside what is attached. Search is listed last in the specification and is the one people actually use all day, which is worth saying out loud when deciding what to build first.
Filters & Rules	What happens to a message automatically on arrival: filed, tagged, sent on to somebody else, or pulled to the top. Every rule that fired is visible on the message, because a mail that quietly vanished into a folder somebody forgot they created is indistinguishable from a mail that was never sent.
Signatures & Auto-reply	The block appended to what goes out, and the answer sent while somebody is away. The away message names who to contact instead, so an absence routes the sender somewhere rather than simply telling them to wait.
Mail Admin Controls	Who may open which mailbox, what is retained and for how long, and what may leave the organisation. This is the half that makes a shared mailbox safe to use for anything a business would mind losing.

Module 28 · Documents

Write it, present it, and keep every version.

A word processor, a presentation tool and notes. Eight lines of the specification that are in truth three substantial products, listed as though they were features — and this module says so rather than implying they are a fortnight of work. Honestly assessed it is the worst effort-to-value ratio anywhere in the design: every business already has these, and nobody adopts a business system for its word processor. It is written down as a named home so the specification is not silent about it, and it is ranked accordingly.

Documents · filed against the records they concern — illustrative figures

Reads from: CRM · Projects & Collaboration **Writes to:** CRM

App	What it does
Word Processor	Writing a document inside the system so it is filed against the record it concerns instead of living on somebody's laptop. The value is not the editor, which is a solved and crowded problem — it is that the document is attached to the order, the case or the person it is actually about.
Presentations	Slides, for the same reason and with the same honest caveat: the point is where the file lives and what it is linked to, not that this is a better tool than the one already on every desk.
Notes	Short-form writing that is not a document — a thought against a customer, a decision against a project. The format most used and least specified, which is usually a sign it should be built before the two above it.
Co-editing & Track Changes	Two people in the same document without one of them overwriting the other, and a visible record of who changed what so an edit can be accepted or undone. This is the genuinely hard part of all three applications above, and the part a business actually notices missing.
Version Recovery	Getting back what a document said before somebody changed it. Listed once in the specification under storage and worth its own line here, because it is the feature nobody asks for until the first afternoon it is needed.

Module 29 · Learning

Teach a process, and know who has been taught it.

Course material, the lessons inside it, an assessment at the end, and a record of who has completed what. Eight lines that are one straightforward application over data HR & Payroll already holds about who works here. Genuinely useful on a factory floor, where a machine or a process has to be taught and the record of who was taught it is what a compliance audit asks for — which makes this the one module in this group with an obvious near-term case.

Learning · who has been taught what — illustrative figures

Reads from: HR & Payroll · Quality & Compliance **Writes to:** HR & Payroll

App	What it does
Courses & Lessons	The material somebody has to work through, in the order it makes sense, in the language the person being taught actually reads. Built over the staff records that already exist rather than a second list of people maintained beside them.
Assessments	A check that something was understood, at the end of a course or as part of hiring. The same mechanism serves both, which is why the specification lists it twice and this design does not build it twice.
Learning Paths & Progress	A sequence of courses for a role, and who is where in it. The record that matters for compliance is this one: not that training was offered, but that a named person completed it on a date, and that the record can be produced when somebody asks for it.

Module 30 · Integration Platform

Connect to other systems without writing a connector each time.

The connector framework, deliberately separate from any individual connector. The framework can be built and tested against recorded responses and needs nobody’s credentials; the connectors themselves each need a live account and are constraints rather than tasks. It only becomes sensible after the Developer Platform exists, because a connector framework with nothing underneath it has nothing to offer the thing it connects to.

Integration platform · connectors and what they may touch — illustrative figures

Reads from: Every module **Writes to:** Every module

App	What it does
Triggers & Actions	The two halves of any integration: something that starts it, and something it then does. Kept as one app because they are meaningless apart — the whole design is that any trigger can drive any action without either knowing what the other is.
Connector Library	A described connection to a named outside system, with how it proves who it is, how often it may be called and its quirks written down once instead of rediscovered by each person who integrates it. A connector nobody can run without credentials still has value as a specification of what connecting would take.
Integration Webhooks & APIs	The framework’s own way in and out, distinct from the product surface in the Developer Platform: this is how a connector receives a push from the far side and how it calls back. Separated because the two have different audiences, and conflating them is how an internal mechanism accidentally becomes a public promise.

Module 31 · Identity & IT

A second factor, and the internal-IT half of the specification.

Four lines that are two quite different things, and the split is worth stating. A second proof at sign-in is small, standard, and should exist before anybody signs in over the internet at all — it is the one item here that matters for a real deployment. The other three are a product for IT departments, which a manufacturer is not. Naming them in

one module rather than scattering them keeps that distinction visible, instead of letting a genuine near-term need sit in a queue behind three things nobody has asked for.

Identity & IT · sign-in and what the trail shows — illustrative figures

Reads from: Platform · Every module **Writes to:** Platform

App	What it does
Second Proof at Sign-in	A second proof at sign-in beyond a password, with recovery codes for the phone that gets lost and a policy for who must use it. The smallest item in this module and the only genuinely urgent one: a system reachable from the internet with a single factor is a system waiting for one reused password to matter.
Password & Secret Management	Where shared credentials live so they stop living in a message thread, with who may retrieve which one recorded. This system never asks for a marketplace, bank or account password of its own; this app is about the credentials a business already has to hold for other things, and the fact that they are currently held badly.
IT Service Desk	Internal requests — a laptop, an account, access to something — as tickets with an owner and a resolution. The same shape as the customer Helpdesk in CRM, pointed inward, and honestly a different product from the one this system is for.
Security Analytics	Sign-ins, failures and unusual patterns, read from the audit trail that already records everything. It needs no new capture because the record is already being kept — what is missing is anybody looking at it, which is what this app would be.

Companies and channels — how many is up to you

Whatever number you have, it is not a setting this system was built around, and it is not a ceiling. A company is a **row**. A channel is a **row**. Every business record carries the company it belongs to, and every sale carries the

channel it came through. Ten companies selling on ten channels each is the same three tables and the same code as one company selling on one.

Three things this buys you, and one it deliberately refuses.

Each company's books are its own. Its trial balance balances on its own. No report can reach across into another company's rows — not by convention, but because a journal line can only point at an account that belongs to the same company, and a test checks that no line anywhere ever does.

The group is the sum minus what you sold yourselves. When one company in a group sells to another, that is revenue in one set of books and cost in another. Adding the companies up would report a group turnover the group never earned from the outside world. Every entry that names a sister company is eliminated at group level, and the consolidation returns all three numbers — gross, eliminated, group — so you can see the elimination rather than take it on trust.

The channel is a dimension of the sale, never of the stock. You can read this month by channel, by company, or by both. What you cannot do is keep a separate stock number per channel, and that is on purpose: the last unit sold on one marketplace has to vanish from the others at that instant, which per-channel inventory cannot do.

And the reporting follows your own sheets. The report's columns come from the sheets that are actually in the workbook you give it. A fourth company is a new sheet, not a new version of the software.

This is checked, not claimed. `core/tests/core.test.js` builds ten companies with ten channels each — a hundred channels — posts an order down every one plus ten inter-company sales, and asserts every company's books balance, that no journal line points at another company's account, and that the group figure is the plain sum minus inter-company trade: ₹2,10,500 gross, ₹50,000 eliminated, ₹1,60,500 group. It then calls the same builder for eleven companies and eleven channels with no code changed.

The rules that hold everywhere

1. **No app depends on any single outside company.** Every capability — books, marketplaces, AI writing, couriers, payments, messaging, storage, GST, printing, barcode — has several interchangeable providers and a by-hand option, so the system works with nothing connected at all. **A provider named as the source of a figure is a bug;** providers move messages and money, the ledger originates numbers.
2. **The books are this system's own.** No other accounting package is required, ever. a desktop accounting package, a desktop accounting package and a business-suite vendor remain available for anyone already running one — nothing assumes them, and no figure is ever sourced from one.
3. **Nothing ever asks for an account password.** Outside services connect with a scoped, revocable key. *This system will never ask you for a marketplace, bank or account password. If any screen ever does, it is not this system.*
4. **Money is integer paise, never a floating-point number,** because float arithmetic accumulates the error that eventually shows up as a trial balance that will not tie.
5. **Values that change over time are effective-dated** — a salary, a price, a tax rate, a commission. March payroll resolves the salary in force *in March*. A missing value is an error, never silently treated as zero.
6. **Nothing is deleted, only deactivated.** A person who leaves keeps their name attached to years of earnings, approvals and audit rows that must still resolve.
7. **The audit trail has no off switch.** Eight years, before-and-after values, as the MCA rule requires — because an audit trail that can be switched off is one that gets silenced exactly when it matters.
8. **Gates, not warnings.** Each app refuses one thing outright, because a warning gets clicked through on a busy afternoon. A cash-on-delivery order cannot be packed below its advance. A bill for more than was accepted cannot be paid. Every gate is also a self-test.
9. **It is not trained. It is built.** No model learns from your data. Every rule is written down, visible on the Wiring screen, and checked by a self-test — so it is right on day one.
10. **You can reach it from anywhere, but it cannot be reached into.** Ask & Print takes a plain line from your phone and sends a PDF back. The office reaches out; the internet never reaches in.

How it is verified

Nothing ships because it looked right on a screen.

1. **The arithmetic, with no screen involved.** Each engine runs in isolation and its self-tests execute against seeded data.
2. **Every screen and every control, in a real browser.** Each build opens in headless Chromium; every screen is visited and every interactive control on it is clicked. Any console error fails the build.
3. **The real job, with the result asserted.** Not "does the button click" but "did the thing happen". A control that looks alive but changes nothing fails the build.

4. **Against a business's own figures.** Where a business already knows the answer, the software has to reproduce it — and where it cannot, the reason is named rather than the number quietly adjusted. In the worked implementation carried furthest, every record in the owner's hand-made reference report is placed into a bucket with a named cause — matched exactly, changed at source, rate added since, a rule that applies, or present only in a source file that has since been restructured and can no longer be read — and the check fails on any record whose difference has no explanation. A mismatch is a bug, not a rounding difference; an unreadable input is a stated limitation, not a passing test.
5. **A structural audit.** Every "comes from" on every Wiring screen must name a module that actually exists, no vendor name may ever be the source of a figure, and the app count in every file must match this one.
6. **The shipped copy, not the working copy.** The packaged archive is extracted and re-tested in the folder a customer would open it in, because a packaging step that quietly renames a file breaks nothing until it is in somebody's Downloads folder.

The honesty charter

This is the standard the build is held to, and it is written down because a standard nobody wrote down is a standard nobody can be held to.

1. **This page describes a design.** Everything on it is what the system is being built to be, and nothing on it claims to already exist. When a part of it is finished, it will say so with the test that proves it — never before.
2. **Counts are counted, never claimed.** Every module and app figure on this page is read from the canonical module list when the page is built. No number here was typed by hand.
3. **Progress is reported as it is.** If tests fail, the failure is shown with its output. If a step was skipped, it is named as skipped. "Done" means implemented, tested and checked against the original request — not "the code has been written".
4. **Every capability names its alternatives.** No part of this system depends on a single outside company. Each layer names what it is built on, at least two replacements, and the interface the rest of the code talks to — so changing a supplier is a setting, not a rebuild.
5. **Uncertainty is surfaced, not smoothed over.** Where something cannot be verified, it is reported as unverified rather than presented as fact.

Every technical word on this page, in plain language

This page uses ordinary words wherever ordinary words will do. Where it could not, the term is here — with an everyday comparison, because a sales page that assumes you already know the jargon is selling to somebody else.

Only the words this page actually uses are listed. Padding it with definitions of terms that never appear would improve a count and make the page worse.

platform

One piece of software that many separate businesses use at the same time, each seeing only its own information.

Ek badi building jisme bahut saare offices hain. Building ek hai, par har office ki chaabi alag — koi kisi aur ke office mein nahin ghus sakta.

module

One area of work in the system — sales, purchase, staff, accounts. Each is a set of screens that belong together.

Dukaan ke alag-alag counters. Ek counter bikri ka, ek kharidi ka, ek hisaab-kitaab ka.

industry pack

A settings file that teaches the system your trade — what you call things, the stages your work moves through, the documents you issue.

Ek hi machine, alag-alag saancha. Saancha badal do, wahi machine doosri cheez banane lagti hai.

database

Where all the information is kept, arranged so any of it can be found instantly and nothing gets lost.

Ek badi almari jisme har cheez apne fix khaane mein rakhi hai — dhoondhne ke liye poori almari palatni nahin padti.

table

One kind of information inside the database — all your customers in one, all your orders in another.

Almari ka ek khaana. Ek khaane mein sirf customers, doosre mein sirf orders.

row

One single record — one customer, one order, one payment.

Register mein ek line. Ek line matlab ek entry.

schema

The written plan of what information the system keeps and how the pieces connect.

Makaan ka naksha. Deewar uthane se pehle kaagaz pe tay hota hai kaunsa kamra kahaan hai.

migration

A recorded change to the shape of the database, so every copy of the system can be updated the same way, in the same order.

Naksha badla toh likh ke rakha — taaki har site pe wahi badlav, usi tarike se ho.

integer paise

Money stored as a whole number of paise instead of a decimal, so amounts are exact and rounding can never quietly lose a rupee.

Paisa hamesha poore paise mein ginte hain, aadha-adhoora kabhi nahin — isliye hisaab kabhi ek rupya idhar-udhar nahin hota.

audit trail

An automatic record of every change — what changed, who changed it, and when.

Har entry ke saath naam aur time apne aap likha jaata hai. Baad mein koi bole "maine nahin kiya", toh register bata deta hai.

API

The agreed way two pieces of software talk to each other, so one can ask the other for something and get a predictable answer.

Waiter. Aap kitchen mein nahin jaate — waiter ko order dete ho, wahi khaana le aata hai. Waiter badal jaaye toh bhi order dene ka tarika wahi rehta hai.

interface

A written promise about what a part of the system does, without saying which product does it — so the product underneath can be swapped without anything above noticing.

Bijli ka socket. Socket ka size fix hai; usme koi bhi company ka plug lag jaata hai.

storage

Where files are kept — photographs, invoices, scanned documents. Different from the database, which keeps information rather than files.

Almari ke bagal wala godown. Register almari mein, par bade dabbe aur photo godown mein.

queue

A waiting line for work that does not have to finish this second — sending a hundred messages, building a big report.

Darzi ki dukaan ka parchi system. Kaam parchi pe likh ke lag gaya line mein; customer khada intezaar nahin karta.

job

One piece of work taken off the queue and done in the background.

Line mein se uthayi gayi ek parchi, ab uska kaam ho raha hai.

deployment

Putting a new version of the software in place so people start using it.

Nayi dukaan kholna ya purani ko naya roop dena — jab tak shutter nahin uthta, customer ko farq nahin padta.

model

The piece of artificial intelligence that reads or writes text, tags a photograph, or answers a question.

Ek bahut padha-likha assistant. Kaam accha karta hai, par har baat pe usse poochho toh kharcha aur waqt dono lagta hai.

provider

A company whose service the system uses — for messages, for payments, for artificial intelligence, for delivery.

Supplier. Ek supplier maal na de toh doosre se le lo — kaam nahin rukna chahiye.

fallback

The next option the system automatically moves to when the first one fails or is unavailable.

Bijli gayi toh inverter. Inverter gaya toh mombatti. Andhera kabhi nahin hota.

role

What a person is allowed to see and do — a manager sees more than a counter staff member.

Chaabi ka guccha. Manager ke paas zyada chaabiyaan, staff ke paas kam.

permission

One specific thing a role is allowed to do, like approving a discount or viewing salaries.

Guchhe ki ek chaabi. Ek chaabi ek darwaza.
