

MODULE 14 · VASTRANGAM SUITE · v3.1

Vastrangam AI Engine

The catalogue workflow, rebuilt AI-first — photographs read by the app, competitors researched live, watermarks erased, 53 designed templates, and reels cut from your own shots.

Desire to Attire · Crafted in Surat. Worn Everywhere.

Vastrangam_AI_Engine.html · 1004 KB · 138/138 self-tests pass · works offline, better with your key

What changed, and why

v2 was built offline-first: a rules-and-templates engine at the centre, with the model treated as an optional upgrade. That single decision is what made it mediocre — filenames instead of eyes, invented competitors instead of research, gradient boxes instead of design. v3 inverts it. The model reads the photographs, searches the live market and cleans the images; the offline engine is still there, but it now labels its own output DRAFT instead of overclaiming.

The workflow

The **Catalogue** is the top of the flow, and it no longer asks you to tag anything. Everything below reads from it.

The Catalogue — one box, and it reads the photograph

Everything starts in the composer: drop the photos, type what you know in your own words, choose which studio runs and how hard it thinks, and press send. What comes back is decided by what is actually in the picture — the garment, a premium colour name with its swatch, the likely fabric and craft, the camera angle, and flags for a supplier watermark or a two-in-one collage.

saved

Catalogue

Drop the photos, say what you know, and choose how hard the engine should work.
Everything downstream — content, images, design, video — reads from here.

Draft — no AI connected — offline templates · connect Gemini on Connectors for real output

Connect a model

 **Drop your photos here**
Any filenames — straight off your phone or WhatsApp. Connect a model on Connectors and each one reads itself.

1 product ready

Anything you want the engine to know — fabric, work, sizes, price story.
e.g. rayon with foil print, 3/4 sleeve, sizes M to XXL only, we sell this at ₹899 wholesale

Draft written offline — connect Gemini for real market research

Ask the Engine

The composer, then the result. Engine picks which studio handles the work; Effort is the same depth switch the Content Engine uses, chosen once here and carried through.

What the filename is allowed to decide

Exactly one thing: the design name, because that is the only fact a photograph cannot supply.

Green_Plazo_C.jpg gives the design **Green Plazo** with the design code **C**, and the colour and pose come from the image. A colour is read off a filename only when it is a real colour word — RAYON_FOILPAN_WINE is Wine, ..._ROYAL_BLUE is Royal Blue. Anything else is left blank for the photograph.

This is a correction. Earlier versions let a filename that merely *looked* like a SKU override the photograph, and on real files that produced products called "Green" in the colour "Plazo", four photos in colours "C", "D" and "E", and every single one posed Front — while the model had already correctly read a green cotton palazzo shot from the back. Six self-tests now hold the rule in place, and anything you type by hand still beats both.

The Content Engine — sixteen phases, not one prompt

The old run made two calls: one research, one rewrite. That is why the output read like a catalogue — one model pass cannot do buyer psychology, a competitor teardown, hooks, listing prose, social, ads, video, lyrics and five marketplaces at the same depth. It averages. Now each phase is its own call on its own prompt, reading what the phases before it established, and you choose the depth per product: Quick (2 calls), Standard (6) or Deep (16).

Content Engine

The 13-phase engine, running offline from the colour, fabric, craft and occasion libraries. A connected model only upgrades the prose — the pack, the uniqueness check and the QA gate run either way.

HOW DEEP SHOULD THE RESEARCH GO?

Quick - 2 calls **Standard - 6 calls** Deep - 16 calls

Psychology, market, hooks, listing, social and the five marketplaces. Three to four minutes.

Generate the full pack

The offline pack is written instantly either way: 4 titles, Shopify HTML, tags, meta, FAQ, social, Sane lyrics, ads, all 5 marketplaces, email, whatsapp and the 9-sheet Excel. Depth decides how much real research goes on top.

Pick a product from the catalog

SKU	PRODUCT	PRICE	
VAR2994	Mehendi Green Anarkali Roman Silk - Zari	₹2,499	Generate
VL1182	Ruby Wine Lehenga Velvet - Zardozi	₹4,999	Generate
V58761	Sage Mist Organza Saree Organza - Sequence	₹1,899	Generate
VK0455	Marigold Cotton Kurti Cotton - Digital Print	₹699	Generate
VSH1210	Rani Fuchsia Sharara Faux Georgette - Gold Print	₹2,899	Generate

Every run

WHEN	SKU	TITLE	PRICE	QA		
2026-08-05	VAR2987	Peacock Teal Chignon Silk Sequence Anarkali for Sangeet with Sequence Work	₹2,159	100%	Open	X
2026-08-07	VL1182	Ruby Wine Velvet Zardozi Lehenga Choli for Reception with Zardozi Work	₹4,999	100%	Open	X
2026-08-03	VAR2994	Mehendi Green Roman Silk Zari Anarkali for Mehendi with Zari Work	₹2,499	100%	Open	X

It takes the brief off you in conversation. Type "mehendi green roman silk anarkali with zari, floor length, XS to 3XL custom, we sell at 2499 mrp 4199" and every spec lands in the panel on the right, with what is still missing marked plainly. This works with no key — the extractor reads your own fabric, craft, colour and occasion libraries out of the sentence.

Quick2 calls~1 min

The market teardown and the listing prose.

Standard6 calls3–4 min

Adds buyer psychology, viral hooks, the social kit and all five marketplaces.

Deep16 calls8–12 min

Adds search targets, content DNA, thumbnail overlays, six ad variations, the 30-second film, the Suno song, fifteen multiplied assets, the 30-day calendar, size-chart copy and rewritten alt text.

Each phase reads what the phases before it established — which is the whole reason the output stops sounding generic. Phases 0, 1 and 1b go out to live Google Search, so the competitors are real sellers at real prices, with their URLs listed.

-h1Mehendi Green Roman Silk Zari Anarkali for Bridal with Zari Work</h1><p>Her mother fixed the pleats, stepped back, and went quiet. That silence said more than the mirror did. At barely 600g, Roman silk - it moves with her - it does not wear her.</p><p>Look closer and the work shows itself: zari - metallic gold thread, woven or hand-applied - temple craft. Surat karigars still map it by hand, one motif at a time. Nothing about it is heavy; all of it reads expensive.</p><table><thead><tr><th>PRODUCT</th><th>SPECIFICATIONS</th></tr></thead><tbody><tr><td>Material</td><td>Roman Silk - medium weight, smooth hand-feel, holds a structured drape</td></tr><tr><td>Details</td><td>Hand, woven or hand-applied - temple craft</td></tr><tr><td>Available Colours</td><td>Mehendi Green</td></tr><tr><td>Dimensions</td><td>Length: gown + inner + 2.3m dupatta</td></tr><tr><td>Weight</td><td>Lightweight</td></tr><tr><td>Care</td><td>Clean Only</td></tr></tbody></table></div></div><div>Handle: SEO - tags - care</div><div><table><tr><td>Handle</td><td>mehendi-green-roman-silk-anarkali-bridal</td></tr><tr><td>SEO title</td><td>Mehendi Green Anarkali for bridal | Vastrangam</td></tr><tr><td>Meta description</td><td>Mehendi Green anarkali in roman silk, zari worked for bridal. Zari that reads premium and weighs almost nothing. Custom-stitched anarkali XS-3XL from Surat.</td></tr><tr><td>Price</td><td>₹1,600 (MRP ₹2,720)</td></tr><tr><td>TAGS</td><td>mehendi green anarkali, roman silk anarkali, anarkali for bridal, what to wear to a bridal, zari anarkali, custom fit anarkali, bridal outfit, vastrangam, festive wear surat, anarkali with dupatta, indian wedding guest, vastrangam</td></tr></table></div><div>Feature highlightsRoman Silk — medium weight, smooth hand-feel, holds a structured drape; reads premium, weighs almost nothing.Hand-mapped zari, scalloped gata-and-pearl hem, floral zari detailing.Built for the bride's own trousseau — done, never bridal.Custom-stitched to your measurements, XS to 3XL — not the usual four sizes.Dry clean only. Unsure of size? Custom sizing at no extra charge.</div><div>FAQ<div>What is the fabric and how heavy is it?<p>Roman Silk — medium weight, smooth hand-feel, holds a structured drape, about 600g.</p>Is custom sizing available?<p>Yes. XS to 3XL, custom-stitched to your measurements at no extra charge. WhatsApp your bust and waist to +91 87580 38161.</p>What occasion is it best for?<p>Built for the bride's own trousseau — mandap and natural light.</p>How do I care for it?<p>Dry clean only to keep the zari and the drape intact.</p></div></div><div>SEO blog opener<div>Ask any tailor in Surat what separates a roman silk anarkali that hangs well from one that does not, and they will not talk about the fabric first. They will talk about where the weight sits. This is what that looks like in a mehendi green built for bridal — and why the zari is placed the way it is.</div></div></div>

A generated run: four title variants with character counts, the humanized Shopify body, and the specification table with no blank cells.

Who writes what

The humanization table you specified is now the contract the engine runs on. The left column is what a model is allowed to write. The right column is generated here and never handed to a model — which is exactly why the character limits, prices, HSN codes and filenames stay correct while the prose stops sounding machine-made.

The 16 phases

0 written this run

The left column is what a model is allowed to write. The right column is generated by the engine and never handed to a model — that is what keeps the character limits, prices, HSN codes and filenames correct.

#	PHASE	HUMANIZED	STAYS STRUCTURED	THIS RUN
0	Buyer Psychology	The way pain-points and desires are phrased	segment tags	built-in copy
1	Market Intelligence	Competitor "why they win" narrative	the comparison table	built-in copy
2	Viral Hooks	Every hook — real, specific, scroll-stopping	—	built-in copy
3	Content DNA	Voice templates rewritten to sound spoken	—	built-in copy
4	Product Content	HTML description paragraphs, FAQ answers, "when and where"	specs table, tags, meta	built-in copy
4C	Social	All captions, all 8 slides, all scripts	hashtag list	built-in copy
4D	Thumbnails	Overlay text lines	dimensions	built-in copy
5	Ad Variations	Every primary text, headline, hook	funnel labels	built-in copy
6	Cinematic Video	On-screen text and emotional beats	timecodes	built-in copy
7	Suno Music	Lyrics (banned-word law)	style tags	built-in copy
8	Marketplace	Amazon bullets, Myntra/Ajio descriptions	attribute schema, HSN, size	built-in copy
9	Scale Engine	Every asset it multiplies	counts	built-in copy
10	Calendar	Caption and hook columns	date, time, status	built-in copy
11	Excel Sheets	Any free-text cell	IDs, prices, dimensions	built-in copy
12	Size Chart	The intro and CTA line only	the measurement numbers	built-in copy
13	SKU Metadata	Alt-text readability	filename, SKU	built-in copy

The sixteen phases with their live state on a finished run: what each one humanized, what it left structured, and how long it took. A phase that fails is recorded and skipped — one bad call never loses the other fifteen.

The QA gate is your spec's real one — all fourteen machine-checkable rules. Title 60–80, SEO description 150–160, exactly 30 hashtags, exactly 8 carousel slides, alt text ≤125 and synced to the Shopify column, SKU written only for VS/VL, Amazon limits, and the 61-column count. It still reads 100% after a full Deep run, because the model never touches the fields it would break.

What comes out — a document you can edit, a sheet you can upload

Two files, and they are the two that were asked for by name. The report follows the fourteen sections of your own Product Content Report, so what the engine produces opens in Word looking like the document you already work from — and every paragraph is editable, because it is a real Word document rather than a locked PDF. The workbook is the one you upload: sheet 1 is the 61-column Shopify import, and every other sheet is a single marketplace in that marketplace's own column order, sized XS–3XL across every colourway. No sheet mixes two platforms, because no platform accepts a mixed file.

Calendar

No sheet mixes two platforms, because no platform accepts a mixed file. Every colourway is sized XS–3XL.

Image Studio — your own tool, embedded whole

The previous Image Studio was a re-interpretation, and it lost most of what your tool did. This screen is `Vastrangam_Image_Studio_Pro.html` itself, byte-for-byte, running in a frame: the same queue, the same watermark eraser with all six algorithms, the same multi-image split, SKU stamp, frames, output presets, batch export and the English/Hindi toggle. Nothing of yours was rewritten. The only added code is a small bridge that joins it to the rest of the app.

Your tool, inside the app, with the catalogue already loaded into its queue — each photo carrying its title, SKU, colour, description and alt text from the SKU grouping, so no metadata is retyped.

The three separate downloads

↓ **JPG** · ↓ **WebP** · ↓ **PNG (transparent)** — three buttons, three separate ZIPs, so you take the format you actually need rather than one mixed archive. JPG and WebP flatten onto white; PNG keeps the transparency the eraser left. Every ZIP carries a `metadata.csv` with the title, SKU, colour, description and alt text for each file.

Three things had to be fixed to make it run offline inside the app. Its CDN script tags are stripped and replaced with this file's own zip and spreadsheet engines. Its Google Fonts link is stripped too — **a pending external stylesheet blocks the next inline script from executing**, which froze the parser at 5.5 KB of a 244 KB document and left the panel blank. And the frame is hosted outside the page body and positioned over a placeholder, because the page is rebuilt on every render and an iframe inside it would be reloaded each time, throwing away your editing queue.

Templates — 53 of them, all live

Nine canvas sizes × eight layout archetypes × palettes including one built from the garment's own colour. Nothing here is a picture of a template: every tile is drawn from your product photo and your content the moment the screen opens.

The gallery. Click any tile to open it on the canvas — edit the text, switch palette, switch layout, or magic-resize to another canvas and watch the layout refit itself.

The banner bug, and the fix

This is the specific defect that made the point. In v2 the web banner put "New Mehendi Collection" straight through the right-hand edge, dropped the subtitle on top of the title, and parked the price pill over both — on a green-to-blue gradient unrelated to the garment. That is not a styling slip; it is what happens when there is no layout engine.

The same banner now. Every string is measured and wrapped before it is drawn and shrunk until it fits its box; every element sits in a declared slot that is collision-checked against every other slot; the price is a pill sized to its own text; and the palette is derived from the garment's own colour.

Two of the 138 self-tests walk **every archetype at every canvas size** with a deliberately over-long title and assert that nothing leaves the canvas and no two elements overlap. The bug cannot come back silently.

The carousel is exactly eight slides now, per your spec — and each slide carries the real copy as its headline, with the stage name as a tag.

Video Studio — cut from your photographs

v2 animated a purple rectangle and a gold bar over black, and never touched your images. Now every pose in the catalogue becomes a moving shot — a slow push-in and pan, cross-dissolved into the next — with the three-act script and the price landing on the right frames.

The screenshot displays the Video Studio interface. The main preview window shows a green gradient background with the word "RAJPATH" in white text. Below the preview is a timeline with a play button, a stop button, and a duration of 0.0s / 20s. The timeline has markers every 2 seconds from 0s to 20s. Below the timeline are four tracks: BG (Background), Video (containing eight "photo" clips), Shape (containing a "rect" clip), and Text (containing a "VASTRANGAM" clip). On the right side, there are three panels: "Add clip" with buttons for "+ Text", "+ Shape", and "Set BG", and a dropdown menu for "LOAD A SUNO / REEL SCRIPT FROM A CONTENT RUN"; "Aspect" with buttons for "9:16 Reel", "1:1 Square", and "16:9 Wide"; and "Export" with buttons for "WebM", "GIF", and "Frames (ZIP)", and a "JSON" button. A note in the Export panel states: "MP4 / H.264 is not encoded in-browser — see [Connectors](#) for the render service. Everything above works with the wifi off." At the bottom right, there is a button labeled "Ask the Engine".

A reel cut from eight catalogue photographs. The timeline shows one photo clip per pose on the Video track, with the script on the Text track. Exports WebM, GIF and a PNG frame sequence, offline.

Honest limit: real AI video generation (Veo) is a paid service. This animates your stills — which is what the free tier can actually do well.

Free-first AI, and what it costs

Everything is free-tier. Your key is stored in your browser only — never in the file, never committed anywhere.

The limits, stated plainly

Capability	Free allowance	What that means for you
Reading photos (vision)	~1,500 calls/day	30 photos a day, many times over
Live competitor research	5,000 grounded searches/month	~160 researched runs a month
AI image cleanup	~500 edits/day	far more than a catalogue shoot needs
Everything else	unlimited, offline	generator, canvas, timeline, spreadsheets, templates

The app queues its calls to stay inside the rate limit, backs off and retries on a 429, and caches every result by image hash — so re-running the same catalogue costs nothing at all.

Connectors — the free-first router. The built-in engine is first and can never be removed; paid providers sit last; nothing is locked to one company.

Two bugs found in the field, and the library

“The self-tests fail after I upload photos”

Root cause: v3 kept a 768px working copy of every photograph inside the record, and the record lives in the browser's 5 MB local storage. Measured on real photographs that is 377 KB each — thirty of them reached 11 MB, the browser refused to save, and the failure was swallowed. Nothing persisted, so after a reload the data was gone and the very first self-test failed. Photographs now live in IndexedDB and the record keeps only their ids.

	v3	now
Record after 30 photos	11.41 MB	53 KB
Browser save	QuotaExceededError, silent	saves, and says so loudly if it ever cannot
Self-tests after reload	failing	138/138 pass

“I checked every Gemini model and the error keeps coming”

Root cause: the model name was hardcoded. A retired id returns 404 no matter how good the key is, so every model looked broken. CORS was ruled out by direct test — Google does allow a local file to call the API. The fix is to stop guessing: the app now asks your key which models it can use, ranks them, and picks the best one itself.

Connectors • model router

Free options first, paid last. Paste a key and it stays in your browser — never in the file, never committed. Everything still works with the built-in offline engine if you connect nothing.

Ask the Engine

Diagnose the connection

which model works?

Asks your key which models it can use, then makes a real call to each and shows exactly what came back. Use this instead of guessing model names.

Run diagnosis

Key format: ~~X~~ No key entered.

Video - background removal

CAPABILITY	FREE (OFFLINE)	PAID, LAST
Video render	WebM - GIF - frames	Veo - Kling - Runway (MP4)
Background removal	auto-cutout - AI model (once)	remove.bg paid
Automation	webhook JSON	Make - n8n - Zapier

The rule

Nothing here is required. The app generates content, edits images, builds video and exports spreadsheets with **none of these connected**. Connect one only to upgrade a step — and swap it any time without touching the rest.

Your Gemini key is used for text and image generation on its free tier. It is stored only in this browser and never written into the file or the repository.

Connectors → Diagnose: it checks the key format, lists what the key can really use, then calls each model for real and prints the exact reply — 200 OK, 404 model not found, 400 API_KEY_INVALID, 429 quota — before switching to whichever works.

A Gemini API key begins **Alza**. A token beginning **AQ.** or **ya29.** is an OAuth token and will never authenticate here — the Diagnose screen now says so in plain words instead of letting you hunt through model names.

The stock library

Three tiers, cheapest first. The built-in set is drawn by the app rather than stored as pictures, so it is sharp at any export size, recolours with your theme, costs almost nothing in file size, and works with the wifi off.

Paisley, mandala, lotus, marigold, diya, jaali, bandhani, peacock, kalash and rangoli; temple borders, zari bands, gold corners and scallops; sale tags, ribbons, rosettes, price flags and starbursts; grain, silk sheen, bokeh, mesh, paper and chevron; plus trust icons. Every one has → Image and → Design.

Tier	Needs	Good for
Built-in	nothing — offline	motifs, borders, badges, textures, icons
My assets	nothing — your uploads	your own logos, props and past picks
Stock photos	Openverse: no key · Pexels/Unsplash: free key	real photographs of people and places
AI generated	Gemini key, or Pollinations with no key	a backdrop that does not exist yet

How it was verified

138/138 self-tests pass · every screen driven in a real browser with zero console errors · with all non-file requests blocked the app still reads a catalogue, generates a full pack at QA 100%, renders all 53 templates and builds the 8-slide carousel — 0 external requests.

The regressions that are now locked down

the banner bug	no template lets text run off the canvas · no two elements overlap
the sheet	61 columns, not 23 · CSV is real comma-separated Shopify import
the counts	exactly 30 hashtags · exactly 8 carousel slides
the windows	title 60–80 · SEO description 150–160 · alt ≤125
the locks	Variant SKU only on VS/VL · size token 2xl never xxl · sleeve never 3/4
the catalogue	a WhatsApp filename yields no invented product name
the image studio	all six inpainting algorithms present and running
the storage bug	no raw pixels in the record · 30 photos stay under 1 MB · survives a reload
the model bug	models discovered from the key · newer families ranked first · an OAuth token is named as such

It will never ask for a password. Channels use scoped, revocable keys only. If any screen asks for a marketplace, bank or account password, it is not this app.
