

VASTRANGAM — ETHNIC-WEAR D2C + MARKETPLACE

CEO Dashboard

Did we make money · Is the cash safe · What needs me today

Module 01 · Dashboard & BI — App 1 of 2

Vastrangam on one screen. Marketplace sales after returns, the real profit once fabric and karigar wages are out, live cash, settlements still stuck, fabric about to run out, and what needs the owner today.

One file · opens by double-click

Works offline

23 / 23 self-tests pass

Reads everything, writes nothing

What this is, and what is inside

The CEO Dashboard is the **one screen you look at each morning**. It answers three questions and nothing else: did we make money, is the cash safe, and what needs a decision today.

You will never type a figure into it. Every number is worked out from records the rest of the business already keeps — marketplace orders and returns, fabric bought, karigar wages, stock and running costs. That is the whole idea: if a number here looks wrong, the record behind it is wrong, and the Wiring screen tells you exactly which one to go and check.

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic **23 different ways** every time it starts.

18. How to run it, and what it will not do

Where the Dashboard sits

Every Medhava app stands on **one shared Data Core**: Item/SKU, Party, Stock, Ledger/Voucher and Order. Each module writes into it; the Dashboard only ever reads from it.

Why this matters. A dashboard that can also change your records is a dashboard you cannot audit. This one is deliberately read-only. The single thing it stores is which alerts you have personally cleared, and that is kept separately from your data.

What it reads, and from where

COMES FROM	WHAT IT SUPPLIES
E-commerce / OMS	Myntra / Flipkart / website orders, returns and settlements
Procurement	Mill bills, fabric rates, payment terms
Inventory	Fabric metres, finished pieces, cost, reorder point
Manufacturing (karigar)	Pieces cut, stitched and finished; wages booked
Accounting & GST	Opening balances, rent, salaries, ad spend, courier, receipts and payments

The process — how a figure reaches this screen

Nothing on the Dashboard is stored. Every time a screen opens, the whole chain below runs again from the raw records. This is what "live" actually means.

The same five steps produce every single number you see.

- 1 A record exists.** An order ships on Myntra, a bill is entered, fabric is issued to the cutting table, karigar wages are booked, the courier bill is paid. The Dashboard is not involved — it is the other modules doing their normal work.
- 2 The period you picked decides what counts.** Choose June and only June's records are included. Choose Full year and all four months are. Balances — cash, money owed, stock — deliberately ignore this, because a balance is a position, not a period.
- 3 Everything is added up from scratch.** Not read from a stored total. This is why the figures can never drift out of step with the records underneath them.
- 4 The rules run.** Returns come off before anything is called "net". Purchases, wages and running costs come off before anything is called "profit". Four alert rules are tested against the fresh figures.
- 5 The screen is drawn.** Cards, tables, bars and the alert list — all from the numbers just calculated. Then it is thrown away and done again on the next click.

The one rule that matters most. Returns are taken off before anything on this screen is called "net". Myntra and Flipkart will both show you a gross figure that feels excellent; this screen shows what is left after the parcels come back — which is the money that actually reaches the bank.

Screen - Overview

The Overview screen. Five cards, the trend on the left, what needs a decision on the right.

Reading it in thirty seconds

- 1

Net profit — did we earn? If it is green you are ahead; the percentage beside it tells you by how much of every rupee sold.
- 2

Cash + bank — are we safe? A business can be profitable and still be unable to pay a bill on Friday. This is the number that answers that.
- 3

Open alerts — what needs me? If it is zero, close the laptop. If it is not, the panel on the right already lists them, worst first, with a button that takes you to the screen where you can act.

Overview, explained card by card

Net sales

What you sold,

after returns have been taken off

. This is not the figure a marketplace dashboard shows you — theirs is gross.

Net profit

What is actually left: net sales – fabric and trims – wages – running costs. The percentage underneath is that profit as a share of net sales.

Cash + bank

Your real position right now. It does

not

change when you switch period — a balance is a balance, not "profit for June".

To collect

Everything the marketplaces and wholesale buyers still owe you, whatever its age.

Open alerts

How many things need a decision. Red the moment there is one.

Net sales by month

A bar per month with that month's profit beside it, the best month, and the four-month totals. The badge compares the newest month with the one before.

What you can click

- ▶ **Any period button** — April, May, June, July or Full year. Every figure on every screen is recalculated.
- ▶ **"Open →" on any alert** — jumps straight to the screen where you can do something about it.
- ▶ **Any menu item** on the left, or the ☰ button on a phone.

Read it in this order: **Net profit** first (did we earn?), then **Cash + bank** (are we safe?), then **Open alerts** (what needs me?). Thirty seconds, and you know where you stand.

Proof that it is live

This is the same screen as the previous page. Only one thing was clicked: the period changed from July to April.

April selected. Every card, both panels and the alert list have been recomputed.

What moved, and what deliberately did not

FIGURE	CHANGED?	WHY
Net sales	Yes	It is a period figure — this is what was sold in April.
Net profit & margin	Yes	Every line that builds it is filtered to April.
Cash + bank	No	A balance is a position, not a period. "Cash for April" is not a thing.
To collect	No	Money owed is owed today, whichever month it arose in.
Open alerts	Partly	Stock and payment alerts are about today. Return-rate alerts are recomputed for the period.

That distinction is the difference between a dashboard you can act on and one that quietly misleads you. Most spreadsheet dashboards filter everything by the date column, which turns a bank balance into nonsense.

Screen - Sales & Channels

This screen exists to answer one uncomfortable question: **which channel looks big but is not?**

Gross, returns, return %, net and units — for every channel, side by side.

Read the "Return %" column first. This matters more here than almost anywhere else. Flipkart at 14% returns on a big gross number can easily earn less than the website at 11% on a smaller one. The table sorts by **net**, not gross, for exactly that reason. Anything at 12% or above is tagged "returns high" and raises an alert.

The four cards

Gross sales

Everything sold, before returns. The flattering number — the one you are shown everywhere else.

Returns

What came back, and what share of gross that is. Turns red above 10%.

Net sales

Gross minus returns. The honest number, and the one every other screen uses.

Units sold

Pieces, not rupees. Useful when comparing a discount-heavy month with a full-price one.

Below the table, the same channels are drawn as bars **by net sales** — so the ranking you see with your eyes is the ranking that actually matters, not the one gross would give you.

Screen - Money

Cash, who owes you, who you owe — and the profit worked out line by line.

How the ageing tags work

	OK / ON TIME	OVERDUE / LATE	CHASE NOW / VERY LATE
Marketplaces & buyers	Under 30 days	Over 30 days	Over 60 days
Mills you owe	Not yet due	Past its due date	Over 60 days late

Net position — cash plus what you are owed, minus what you owe — is the card to watch. Healthy profit with a negative net position means the money is sitting in somebody else's account, not yours.

The profit build-up panel at the bottom is the most useful thing on this screen. It shows profit line by line — net sales, minus fabric and trims, minus wages, = gross profit, minus running costs, = net profit. Every line moves when you change the period, so you can see exactly which line is eating the margin.

Screen - Stock & Making

What you are holding, what is running out, and what the floor produced.

The tag on the right of the stock table is the part to act on: "reorder" means at or below the reorder point — order it today. "low" means within twice the reorder point — order it this week. "ok" means leave it alone.

Cost per piece, in the production table, is the number to watch over time. If wages climb faster than pieces, every piece is costing more and the margin is shrinking quietly.

The four cards

CARD	WHAT IT MEANS	WHAT TO DO ABOUT IT
Stock value	Everything held, valued at what it cost you	If this keeps climbing while sales do not, cash is being buried in stock.
Running out	Items at or below their reorder point	Any number above zero is a purchase list for today.
Pieces made	What the floor finished in this period	Compare with units sold — making far more than you sell is how stock value climbs.
Making cost	Wages paid for that output	Divide by pieces made and watch the trend month to month.

Why the reorder point, and not a percentage. A percentage of stock tells you nothing about how long it takes to replace. The reorder point is set per item, from how long the mill takes to deliver it — so "reorder" genuinely means "order it today or you will run out".

Screen · Alerts — the four rules

Nobody types these in. They are worked out from your live figures every time the screen opens. Exactly four rules produce every alert in the system:

- 1

Stock at or below its reorder point. Marked **urgent**. This is the one that stops the karigar floor. Fabric below its reorder point means a cut plan cannot start, and idle karigars cost wages without producing pieces.
- 2

Somebody has owed you money for more than 30 days. Marked **watch** — or **urgent** past 60 days.
- 3

A bill you owe has gone past its due date. Marked **watch** — or **urgent** past 60 days late.
- 4

A channel's return rate has reached 12% or more. Marked **watch**. At that level it is almost always a size-chart, fabric-description or photography problem — something you can fix — not bad luck.

Cleared

You have cleared 1 alert(s). They come back automatically if the situation gets worse.

Bring them all back

Alert cleared ✓

One alert cleared. The count drops, and a "Cleared" panel appears with a way to bring them all back.

Clearing changes nothing in your business. It only records that you have seen it. If the underlying situation gets worse — the stock falls further, the payment goes another month late — the alert comes straight back on its own. "Bring them all back" undoes every clear at once.

Why clearing exists at all

- ▶ **An alert list you cannot tick off is an alert list you stop reading.** After a week of seeing the same four lines, your eye skips them — and then you miss the fifth.
- ▶ **Clearing is personal, not shared.** It is stored separately from your business data, so a backup restore never brings back a stale "handled" flag.
- ▶ **It cannot hide a real problem.** The alert is recalculated from live figures every single time the screen opens. Clearing suppresses one specific alert; the moment the underlying rule fires again on worse numbers, it is back.
- ▶ **The "Cleared" count on this screen** tells you how many you are currently suppressing, so nothing is hidden from you either.

Screen - Wiring

Where every number comes from

The dashboard owns no data of its own. It reads the shared Data Core and shows you the result.

Shared Data Core: Item/SKU · Party · Stock · Ledger/Voucher · Order — every module reads and writes these.

Every figure on this dashboard, and its source

FIGURE HERE	COMES FROM	HOW IT IS WORKED OUT
Net sales	E-commerce / OMS + Sales	Myntra / Flipkart / website orders added up, minus every return and cancellation, for the period you picked
Return %	E-commerce / OMS (returns)	Returns + gross sales, per channel — Myntra and Flipkart are tracked separately because their return behaviour is different
Net profit	Sales + Purchase + HR & Payroll + Accounting & GST	Net sales – fabric purchases – karigar wages – running expenses (rent, salaries, ads, courier)
Cash + bank	Accounting & GST (ledger)	Opening balance + everything earned or spent since — a true balance, not a period figure
To collect	Settlement + Sales (B2B invoices)	Money the marketplaces and wholesale buyers still owe, aged in days
To pay	Purchase (Accounts Payable)	Unpaid mill and zari bills, showing days late or days remaining against agreed terms
Stock value	Inventory & Catalog (fabric and finished)	Metres / pieces on hand × cost, item by item — one stock number, not one per channel
Running out	Inventory & Catalog (reorder points)	Any fabric or SKU that has fallen to or below its reorder point — this is what stops a cut plan
Pieces made / making cost	Manufacturing (karigar floor)	Pieces finished and wages booked by the tailoring unit for the period
Alerts	All of the above	Rules on live figures — fabric below reorder, settlement over 30 days, mill bill past due, channel return rate 12% or more

Live example — one sale

1

A sale is recorded in Myntra.

2

→ Net sales and the channel table on this dashboard move immediately.

3

→ Stock falls; if it crosses the reorder point an alert appears here.

4

→ Money: the customer balance is added to "to collect".

5

→ Net profit recalculates: net sales – purchases – wages – expenses.

This dashboard writes nothing

It is a read-only view of the business. Clearing an alert is the only thing stored, and only for you.

That is deliberate: a dashboard that can change your books is a dashboard you cannot trust.

Alert cleared ✓

Every figure on the Dashboard, its source, and how it is worked out.

Below the table it follows **one single sale** the whole way through: the sale is recorded → net sales and the channel table move → stock falls → if that crosses a reorder point an alert appears → the customer balance is added to "to collect" → net profit is recalculated. Five consequences, from one entry, with nothing typed twice.

And the statement at the bottom of that screen is the important one: this dashboard writes nothing. It is a read-only view of the business. Clearing an alert is the only thing it ever stores, and only for you. That is deliberate — a dashboard that can change your books is a dashboard you cannot trust.

Every figure, and how it is worked out

This is the same table as the Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Net sales	E-commerce / OMS + Sales	Myntra / Flipkart / website orders added up, minus every return and cancellation, for the period you picked
Return %	E-commerce / OMS (returns)	Returns ÷ gross sales, per channel — Myntra and Flipkart are tracked separately because their return behaviour is different
Net profit	Sales + Purchase + HR & Payroll + Accounting & GST	Net sales – fabric purchases – karigar wages – running expenses (rent, salaries, ads, courier)
Cash + bank	Accounting & GST (ledger)	Opening balance + everything earned or spent since — a true balance, not a period figure
To collect	Settlement + Sales (B2B invoices)	Money the marketplaces and wholesale buyers still owe, aged in days
To pay	Purchase (Accounts Payable)	Unpaid mill and zari bills, showing days late or days remaining against agreed terms
Stock value	Inventory & Catalog (fabric and finished)	Metres / pieces on hand × cost, item by item — one stock number, not one per channel
Running out	Inventory & Catalog (reorder points)	Any fabric or SKU that has fallen to or below its reorder point — this is what stops a cut plan
Pieces made / making cost	Manufacturing (karigar floor)	Pieces finished and wages booked by the tailoring unit for the period
Alerts	All of the above	Rules on live figures — fabric below reorder, settlement over 30 days, mill bill past due, channel return rate 12% or more

The arithmetic, in one place

NAME	WORKED OUT AS
Net sales	gross sales – returns
Return %	returns ÷ gross sales × 100
Gross profit	net sales – fabric and trims – wages
Net profit	gross profit – running costs
Margin %	net profit ÷ net sales × 100
Cash + bank	opening cash + opening bank + all-time net profit
Stock value	for every item: quantity × cost, added together
Net position	cash + what you are owed – what you owe
Cost per piece	wages for the month ÷ pieces made that month

Every figure is rounded to two decimal places at the moment it is calculated, so a total can never disagree with the rows above it by a stray paisa.

Connectors — nothing is locked to one company

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service.** Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

No printer — share the PDF	by hand	—

Two things worth knowing

Switching a provider **never** changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and your shipping records stay exactly as they were — only new labels come from somewhere else.

Cloud services are connected with a **scoped, revocable key** — **never** your account password. A key can be limited to just what it needs and cancelled in one click, from their side, without changing your login. Medhava will never ask you for a marketplace or bank password.

"Outside services required: 0" is not a marketing line — it is one of this app's self-tests.

The three rules the app enforces on itself

- 1 No capability has only one choice.** Every one has at least three; most have eight to twelve.
- 2 Every capability has a built-in or by-hand option** — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3 Every capability has an option you can host yourself** — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

The CEO Dashboard uses **4** capabilities and offers **34** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Books & ledger	Medhava Books (built in) · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext (self-hosted) · CSV to your CA
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajio · Nykaa · JioMart · Shopify · WooCommerce · your own store
Files & backups	This device · a USB drive · MinIO or Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2
Printing	Browser print / PDF · any ESC/POS thermal printer · Zebra · TVS · no printer at all

Cloud services use a scoped, revocable key — never your password. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password.** If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 23 self-tests, in full

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	net sales = gross – returns
✓ pass	July gross sales = 676000
✓ pass	gross profit = net sales – purchases – wages
✓ pass	net profit = gross profit – expenses
✓ pass	channel net totals equal overall net sales
✓ pass	period filter works: months add up to all
✓ pass	switching period changes the numbers
✓ pass	stock value = qty × cost
✓ pass	low stock list only items at/below reorder
✓ pass	receivables total = sum of balances
✓ pass	alerts are raised for every low-stock item
✓ pass	an overdue receivable (>30d) raises an alert
✓ pass	clearing an alert removes it
✓ pass	cash balance is a real position, not a period figure
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click `CEO_Dashboard.html`. It opens in your browser. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then : → **Add to Home screen** and it behaves like any other app.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Your figures live in your own browser on your own device — nowhere else, and never on anybody's server. That means nobody can see them, and also that clearing your browser's site data would erase them. So: **Backup & Health** → **Export JSON**, once a week. To move to another device, take the file and the backup with you and use **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ In this single-file form it does not pull live from your marketplace panels; the hosted version of Medhava is what connects those pipes.
- ▶ It will not stop you recording something silly. It checks its own arithmetic, not your judgement.

Accepted when: the app opens by double-click with no internet · all 23 self-tests show pass · switching the period changes every figure · an alert can be cleared and brought back · a backup exports and imports cleanly.
