

UNIFIED ERP — ANY INDUSTRY

Documents & eSign

Filed against the record it belongs to · signed with a one-time code

Module 02 · CRM — App 2 of 4

Every agreement, certificate and scan filed against the record it belongs to — found by that record, not by remembering a folder.

- One file · opens by double-click
- Works offline
- No code, no signature
- 41 / 41 self-tests pass

What this is, and what is inside

Every agreement, certificate, receipt and scan, filed against the order, party, project or person it actually belongs to — and found by opening that record.

A document belongs to something: an order, a party, a project or case, a person. File it there and it is found by opening that record — which is how anybody actually looks for it. Send one out for signature and the signed copy files itself back against the same record. A signature here means a one-time code went to the named signer and came back: the app will not mark anything signed without one, because a signature nobody can evidence is worse than no signature at all. What a document can be filed against is a setting, not an assumption — a practice files against a case, a workshop against a job, and both are this one field.

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic and its own rules **41 different ways** every time it starts.

What this document covers

1. What this is, and what is inside
2. The spine of this module: one record
3. Screen · Overview
4. Screen · All documents
5. Filing against nothing — refused
6. What a signature actually is here
7. The refusal, and then the real thing
8. Every figure, and where it comes from
9. Connectors — nothing is locked to one company
10. The three rules the app enforces on itself
11. What this app can be wired to
12. The 41 self-tests, in full (1 of 2)
13. The 41 self-tests, in full (2 of 2)
14. How to run it, and what it will not do

The spine of this module: one record

The three apps in Module 02 are not three programs that talk to each other. They are **three views of one record** — the party.

What this app reads, and from where

COMES FROM	WHAT IT SUPPLIES
CRM	Which parties exist, so a document can be filed against one
Sales	Which orders exist, so a certificate or note can be filed against one
Projects & Collaboration	Projects and cases a document can belong to
HR & Payroll	People a document can belong to
Accounting & GST	Invoice copies filed against the order they were raised for

All four apps of this module are built from one engine file and one screen file. Not four codebases that agree — one implementation, compiled four times.

Documents · Overview

What is on file, and what is waiting

A document belongs to a record, not to a folder. This screen is what is outstanding across all of them.

ON FILE

12

documents

WAITING ON A SIGNATURE

2

sets, nothing back

EXPIRING WITHIN 60 DAYS

4

renew or lose the terms

FILED AGAINST NOTHING

0

the record does not exist

By state

STATE	WHAT IT MEANS	DOCUMENTS
draft	Written, not sent to anybody yet	1
sent	Out for signature, one-time code issued	2
signed	A code came back and is recorded against it	4
declined	The signer said no	1
filed	Filed for the record — nothing to sign	4

Expiring soonest

DOCUMENT	FILED AGAINST	DAYS LEFT
Quality certificate — annual	Party P5	5
Quality certificate — batch 4471	Order SO-1013	15
Supply agreement renewal	Party P3	31
Rate contract — standard line	Party P2	51

An agreement that lapses quietly is a rate that resets quietly. This is the list to work down.

What is on file, what is waiting on a signature, what expires soon, and what is filed against nothing.

The fourth card is the one to watch: "filed against nothing". A document whose record does not exist is in the system and unfindable from the only place anybody would look for it. That is the single fault that makes a filing system useless, so it has its own card, and filing one is refused in the first place.

Expiring within 60 days is the list to work down each month. An agreement that lapses quietly is a rate that resets quietly.

TITLE

KIND OF DOCUMENT

FILED AGAINST

WHICH RECORD

WHO SIGNS IT (LEAVE EMPTY TO JUST FILE IT)

EXPIRES ON (OPTIONAL)

File it

Which record must be a record that exists — a party code, an order number, or the name of the Project or case or Person it belongs to. Filing against nothing is the one thing this app will not let you do quietly.

Every document, what it is filed against, who signs it, when it expires, and what state it is in.

The five states

STATE	WHAT IT MEANS
draft	Written. Sent to nobody.
sent	Out for signature. A one-time code has gone to the named signer.
signed	The code came back and is recorded against the document.
declined	The signer said no.
filed	Nothing to sign — a certificate, a note, a copy. It is here to be found.

"Filed against" accepts a party, an order, a project or case, or a person. What is on that list is a **setting**, not something the software believes — which is how the same app serves a practice filing against a case and a workshop filing against a job.

File it

Which record must be a record that exists — a party code, an order number, or the name of the Project or case or Person it belongs to. Filing against nothing is the one thing this app will not let you do quietly.

Refused, with the reason: it could never be found from that record.

This is not fussiness. The whole promise of this app is that a document is found by opening the record it belongs to. A document filed against a record that does not exist breaks that promise silently — it looks filed, and it is lost.

File it

Which record must be a record that exists — a party code, an order number, or the name of the Project or case or Person it belongs to. Filing against nothing is the one thing this app will not let you do quietly.

A document out for signature. The only way to mark it signed is the code that went to the signer.

- 1
- Written. It is a **draft** — sent to nobody. A draft cannot come back signed before it goes out; that is refused.
- 2
- You send it. A six-digit **one-time code** goes to the named signer. If nobody is named, sending is refused — there would be nowhere to send it.
- 3
- They read the code back. You record it. **Only now** is it signed, and the code is kept against the document.

A one-time code is not a password. This app never asks a signer for a login, and Medhava will never ask you for a marketplace, bank or account password. If any screen ever does, it is not Medhava.

The refusal, and then the real thing

File it

"Which record" must be a record that exists — a party code, an order number, or the name of the Project or case or Person it belongs to. Filing against nothing is the one thing this app will not let you do quietly.

The code box left empty. Refused, in words.

There is no other route to "signed". Not a tick box, not a menu, and not an import — a spreadsheet claiming a signature with no code against it is refused on the way in too. An import that can do what a form refuses is a back door, and everybody learns to use it.

Every figure, and where it comes from

This is the same table as the app's Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Documents on file	This app	Every document, with the record it is filed against
Filed against	CRM + Sales + Projects + HR	A party, an order, a project or case, or a person — whichever the document actually belongs to
Awaiting signature	This app	Sent to the signer, one-time code issued, nothing back yet
Signed	This app	A six-digit one-time code came back from the named signer and is recorded against the document
Expiring soon	This app	Anything with an expiry date inside the next 60 days, oldest first
Filed against nothing	This app + CRM + Sales	A document whose record does not exist — the one thing that makes a filing system useless
On a customer record	CRM	Everything filed against that party, or against one of their orders

The rules of the whole module, in one place

RULE	WHAT IT MEANS IN PRACTICE
One party, never two	Winning a deal for an organisation already on the books attaches to that record. Two records for one customer means two answers to "what are they worth".
A document belongs to a record	Not to a folder. Filing against a record that does not exist is refused, because the document could never be found from the only place anybody looks.
A signature is a one-time code	Six digits, to the named signer, back from them, recorded against the document. No code, no signature — including on import.
The first-reply clock is derived	The gap between the ticket opening and our first message. There is no field to type it into.
A ticket cannot be closed unanswered	Ignoring somebody and marking it "resolved" is refused.
A ticket names its own party's order	Attaching anybody else's is refused, on screen and on import.
Behaviour groups are rules	Order count and days since the last order. Nobody tags anybody by hand, so nothing goes stale.

Connectors — nothing is locked to one company

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service**. Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

"Outside services required: 0" is not a marketing line — it is one of this app's self-tests.

The three rules the app enforces on itself

- 1

No capability has only one choice. Every one has at least three; most have eight to twelve.
- 2

Every capability has a built-in or by-hand option — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3

Every capability has an option you can host yourself — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

Documents & eSign uses **5** capabilities and offers **41** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Automation	Medhava Rules · n8n (self-hosted) · Node-RED (self-hosted) · Windmill (self-hosted) · Apache Airflow · n8n Cloud · Make · Zapier · Pipedream · Cron + webhook · Do it by hand
Customer messaging	Copy the message and send it yourself · WhatsApp Cloud API · Gupshup · Interakt · MSG91 · Twilio · Email instead (any SMTP) · Chatwoot (self-hosted)
Email sending	Download the PDF and email it yourself · Any SMTP server · Amazon SES · SendGrid · Postmark · Mailgun · Zoho Mail · Brevo
Files & backups	This device · A USB drive · MinIO (self-hosted) · Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2
Printing	Browser print / PDF · Any ESC/POS thermal printer · Zebra label printer · TVS printer · No printer — share the PDF

Cloud services use a **scoped, revocable key** — **never your password**. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password**. If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 41 self-tests, in full (1 of 2)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	every button this app offers is really on one of its own screens
✓ pass	every document names what it is filed against
✓ pass	nothing on file is filed against a record that does not exist
✓ pass	a document filed against a party is found from that party
✓ pass	a document filed against an ORDER is also found from that order's party
✓ pass	what a document may be filed against is a setting, not a fixed list
✓ pass	a record that does not exist is recognised as not existing
✓ pass	there is a document out for signature
✓ pass	marking it signed with no code at all is refused
✓ pass	the refusal explains that a signature must be evidenced
✓ pass	a code that is not six digits is refused
✓ pass	the document is still unsigned after both refusals
✓ pass	a six-digit code signs it
✓ pass	the code is recorded against the document, not thrown away
✓ pass	the signing date is recorded too
✓ pass	signing the same document twice is refused
✓ pass	and the original code is not overwritten by the second attempt
✓ pass	there is a draft on file
✓ pass	a draft cannot come back signed before it goes out
✓ pass	a draft with a named signer can be sent
✓ pass	sending it twice is refused

The 41 self-tests, in full (2 of 2)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	a document with nobody named as signer cannot be sent
✓ pass	expiring documents are listed soonest first
✓ pass	everything in that list really does expire within 60 days
✓ pass	a document with no expiry date is never listed as expiring
✓ pass	a good document imports
✓ pass	a document claiming to be signed with no code is refused on import
✓ pass	a document filed against a party that does not exist is refused on import
✓ pass	and the reason says it could never be found from that record
✓ pass	accepted plus rejected always equals what was in the file
✓ pass	this app can do six things, and none of them writes to another module
✓ pass	every document type offered is one the company set up
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click the `.html` file. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ⋮ → **Add to Home screen**.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Your records live in your own browser on your own device — nowhere else, and never on anybody's server. Take a backup weekly: **Backup & Health** → **Export JSON**. To move to another device, carry the file and the backup, then **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It does not sign anything on your behalf. It records that a code went out and came back, which is the only thing a signature can honestly be.
- ▶ It does not store the document files themselves in this single-file form — it stores the record, the state and the evidence.
- ▶ In this single-file form it does not pull live from your other systems; the hosted version of Medhava is what connects those pipes.
- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ It will never ask you for a marketplace, bank or account password. If any screen ever does, it is not Medhava.

Accepted when: the app opens by double-click with no internet · all 41 self-tests show pass · a document cannot be marked signed without a six-digit one-time code · a document cannot be filed against a record that does not exist · a backup exports and imports cleanly.
