55 / 55 self-tests pass

The date is derived, never typed

What this is, and what is inside

Website, marketplaces, the counter, wholesale and WhatsApp all land in **one order book**. Two decisions then decide whether the customer is happy, and this app makes both of them in the open.

The first is where it ships from. The fastest warehouse that actually holds the pieces, checked against the real figure on that shelf — so a picker is never sent to an empty rack, and an order nothing can serve is shown as exactly that rather than being given a hopeful date.

The second is what date the customer was given. It is the cut-off plus that warehouse's transit days to that zone. **Nobody types it.** So nobody can promise Tuesday to a zone the courier reaches on Friday — and moving the stock to a nearer warehouse changes the date on the customer's order in the same instant.

After the sale the sequence never bends: parcel back, then somebody actually looks at it, then the money goes out. A resaleable piece returns to the warehouse it left; a damaged one is written off rather than quietly added back as stock that does not exist.

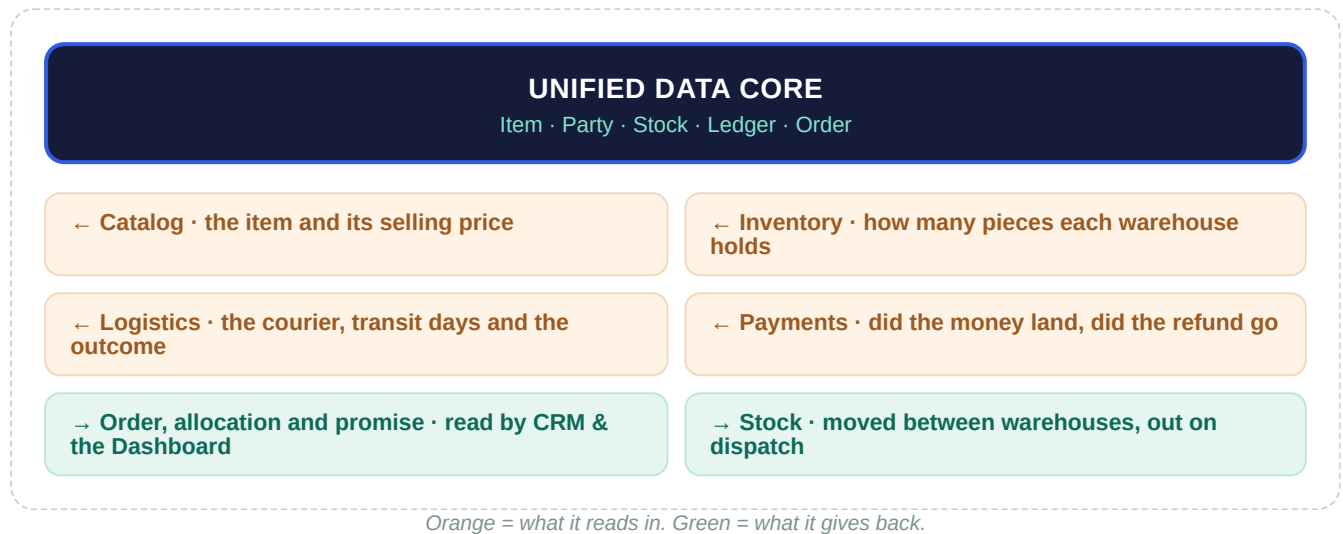

The transit matrix — days from each warehouse to each zone — is one small table, and it is the reason allocation matters at all. The same order is a one-day delivery from one warehouse and a four-day delivery from another.

24. How to run it, and what it will not do

Where Order Management sits

Every Medhava app stands on **one shared Data Core**: Item/SKU, Party, Stock, Ledger/Voucher and Order.

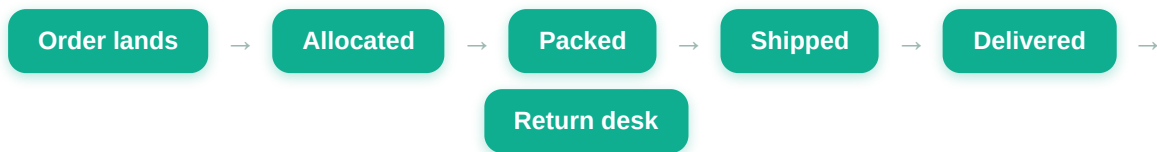

What it reads, and from where

COMES FROM	WHAT IT SUPPLIES
Catalog	The item, its name and its selling price
Inventory & Catalog	How many pieces each warehouse actually holds
Logistics	The courier, the transit days per zone and the delivery outcome
Payments	Whether the money came in, and whether the refund went out
CRM	Who the customer is, and what they have returned before

What this app owns: the order, which warehouse it is allocated to, the promise date derived from that, and the returns desk.
What it only reads: the price, the stock figure and the delivery outcome.

The process, end to end

Six steps. Nothing ships without an allocation, and no refund moves without an inspection.

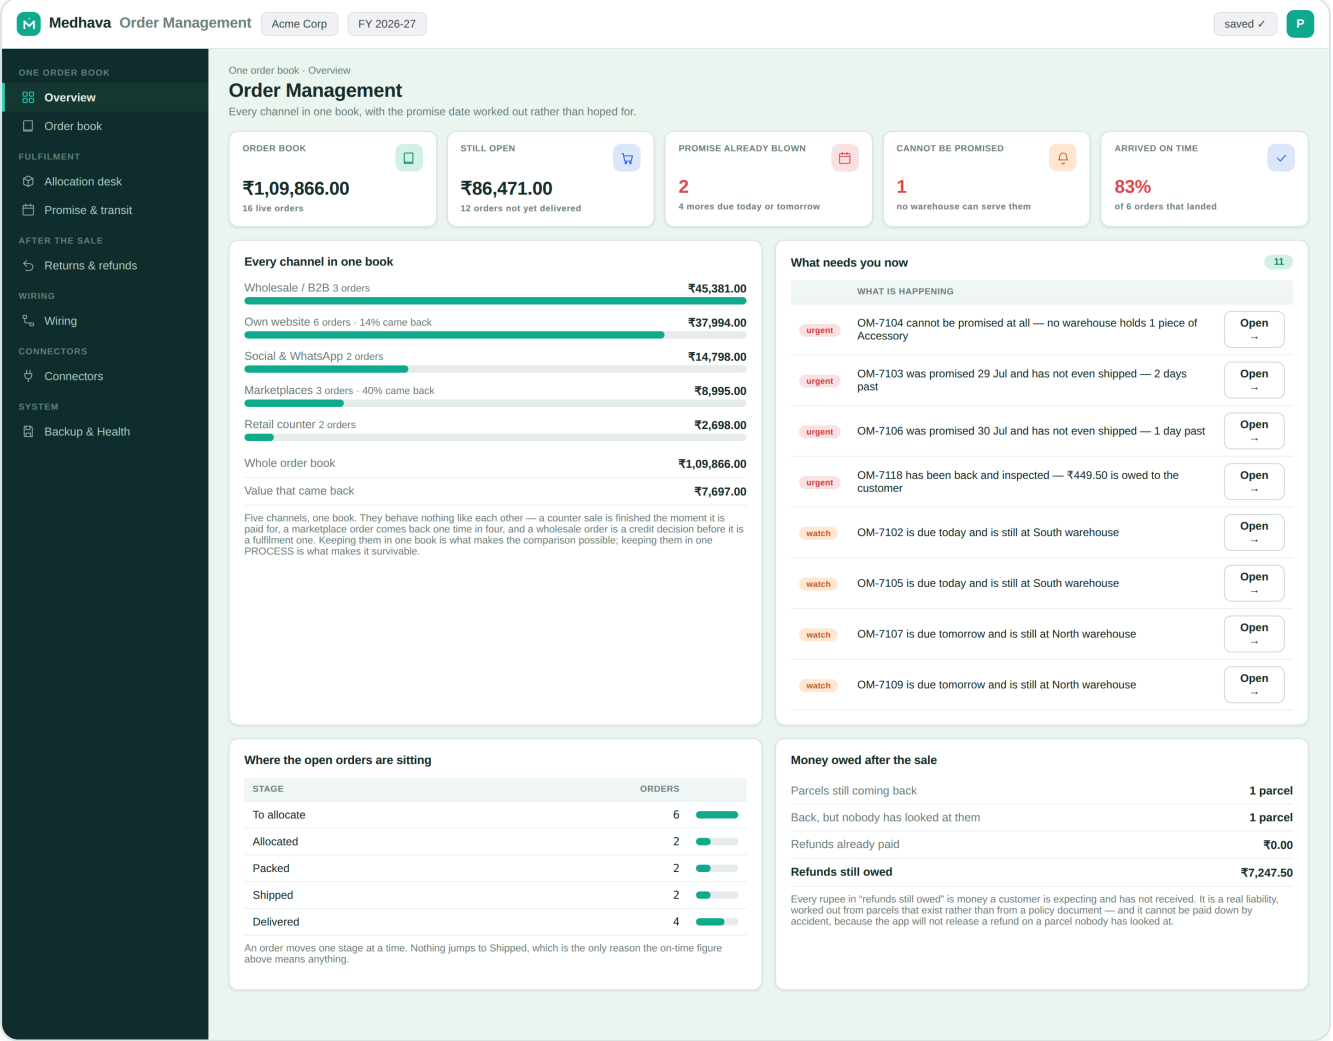

- 1 **An order lands** from any channel and joins one book — not a channel-specific list.
- 2 **Allocated** to the fastest warehouse that actually holds the pieces. The stock there falls; no other warehouse is touched.
- 3 **The promise date appears by itself** — cut-off, then that warehouse's transit to that zone. Change the warehouse and the date changes with it.
- 4 **Packed, then shipped** — never shipped without an allocation, so the on-time figure cannot be back-filled.
- 5 **Delivered** on or before the promise, or it counts against on-time. There is no third option and the promise is never re-written to match.
- 6 **If it comes back:** parcel in, eyes on it, *then* money out. A resaleable piece returns to the warehouse it left.

The three things this app refuses to let happen

- ▶ **Nothing ships from a warehouse that does not have it.** Allocation is compulsory and is checked against the real figure at that location. An order no warehouse can serve gets no date at all — it needs a purchase or a production order, not a promise.
- ▶ **No money leaves before the goods are back and looked at.** A refund is impossible until the parcel is received *and* inspected. That single ordering is the whole difference between a returns policy and a leak.
- ▶ **A promise date is never typed.** It is derived, every time it is read, from the cut-off and the transit matrix. A field somebody has to keep up to date is a field that is wrong within a month.
- ▶ **A damaged return is not added back to stock.** Pretending a stained piece is resaleable is how a healthy-looking inventory turns out to be worth half of what the report says.

All four are self-tests, including "a refund is impossible before somebody has looked at it" and "no promise date is stored anywhere — it is worked out on every read".

Screen - Overview

The order book, what is still open, and every promise that is already gone.

Reading it in twenty seconds

- 1

Promise already blown — orders that have not even shipped and whose date has passed. This is the number a customer is about to phone about.
- 2

Cannot be promised — orders no warehouse can serve. They have no date, on purpose.
- 3

Refunds still owed — money customers are waiting for, worked out from parcels that exist rather than from a policy document.

Retail counter paid and taken away	2	2,698.00	1	—	—	100% behaving

The same book, narrowed to a single channel.

The channels behave nothing like each other — a counter sale is finished the moment it is paid for, a marketplace order comes back one time in four. The table underneath compares them on the figures that matter: open orders, blown promises, return rate and on-time percentage.

HOW MANY PIECES

1

Move the stock

A move takes the pieces out of one warehouse and puts the same number into another. The total across the business never changes — which is exactly why it is safe to do it from this screen.

Where each warehouse earns its keep

WAREHOUSE	PIECES	ORDERS FROM HERE	VALUE	AVERAGE TRANSIT	FASTEST TO
North warehouse Delhi NCR	18	6	35,988.00	3.4d	North, East, North-east & hills
West warehouse Mumbai	11	3	19,797.00	3.6d	West
South warehouse Bengaluru	8	1	4,999.00	3.8d	South

What is on each shelf, and every waiting order with its options.

Each waiting order gets its own panel showing **every warehouse**: how many pieces are there, how many days it is from the customer, and **the date that warehouse would promise**. You are choosing between dates, not between warehouse codes.

Retail counter paid and taken away	2	2,698.00	1	—	—	100% behaving

The same order, now shipping from the nearer warehouse — with an earlier date.

This is the app in one picture. Nobody edited a date. The stock moved, the fastest warehouse that can serve the order changed, and the date the customer is promised changed by itself. A promise date that is stored in a field could never do this.

Allocating for real

What is in each warehouse

ITEM	NORTH WAREHOUSE	WEST WAREHOUSE	SOUTH WAREHOUSE	EVERYWHERE
Standard product PG-101	14	9	6	29
Premium product PG-102	2	2	0	4
Accessory PG-103	0	0	0	0 nothing anywhere
Top-of-range product PG-104	1	0	2	3

OM-7102 - Standard product × 2 - Chennai

South

WAREHOUSE	IN STOCK THERE	TRANSIT	WOULD PROMISE		
South warehouse	6	1 day	31 Jul	can serve it	Ship from here
West warehouse	9	3 days	02 Aug	can serve it	Ship from here
North warehouse	14	4 days	03 Aug	can serve it	Ship from here

Left alone, this order ships from South warehouse and is promised 31 Jul

Allocate the fastest way

OM-7103 - Standard product × 12 - Pune

Pune

WAREHOUSE	IN STOCK THERE	TRANSIT	WOULD PROMISE		
West warehouse	9	1 day	27 Jul	cannot	not enough stock
North warehouse	14	3 days	29 Jul	can serve it	Ship from here
South warehouse	6	3 days	29 Jul	cannot	not enough stock

Left alone, this order ships from North warehouse and is promised 29 Jul

Allocate the fastest way

OM-7104 - Accessory × 1 - Jaipur

North

WAREHOUSE	IN STOCK THERE	TRANSIT	WOULD PROMISE		
North warehouse	0	1 day	01 Aug	cannot	not enough stock
West warehouse	0	3 days	03 Aug	cannot	not enough stock
South warehouse	0	4 days	04 Aug	cannot	not enough stock

Allocated to North warehouse — promised 05 Aug

Nothing can serve this order. There are no pieces at any warehouse, so no stock to promise. This means a purchase of a production order, not a promise — and nothing is gained by giving the customer a date in the meantime.

OM-7105 - Top-of-range product × 1 - Mysuru

South

WAREHOUSE	IN STOCK THERE	TRANSIT	WOULD PROMISE		
South warehouse	2	1 day	31 Jul	can serve it	Ship from here

Allocate the fastest way

Move stock between warehouses

ITEM

Standard product

OUT OF

North warehouse

INTO

North warehouse

HOW MANY PIECES

1

Move the stock

A move takes the pieces out of one warehouse and puts the same number into another. The total across the business never changes — which is exactly why it is safe to do it from this screen.

ITEM	OUT OF	INTO	PIECES
Premium product	West warehouse	South warehouse	1
Premium product	South warehouse	West warehouse	1

Where each warehouse earns its keep

WAREHOUSE	PIECES	ORDERS FROM HERE	VALUE	AVERAGE TRANSIT	FASTEST TO
North warehouse Delhi NCR	17	7	40,987.00	3.4d	North, East, North-east & hills
West warehouse Mumbai	11	3	19,797.00	3.6d	West
South warehouse Bengaluru	8	1	4,999.00	3.8d	South

The order is against a warehouse, and the stock came off that shelf and no other.

Three assertions run on this one click in the build: the order became allocated, the stock at that warehouse fell by the quantity, and **every other warehouse was left alone**. A stock movement that touches a location it had nothing to do with is the kind of bug that is invisible for months.

Fulfillment - The promise

Promise & transit

A promise date is never typed here. It is the cut-off plus that warehouse's transit days to that zone.

PROMISE BLOWN

2

not shipped, date gone

DUE TODAY OR TOMORROW

4

pack these first

LATE IN TRANSIT

1

shipped, still past the date

ARRIVED ON TIME

83%

of 6 orders that landed

The transit matrix — days from each warehouse to each zone

WAREHOUSE	NORTH	WEST	SOUTH	EAST	NORTH-EAST & HILLS
North warehouse Delhi NCR	1d	3d	4d	3d	6d
West warehouse Mumbai	3d	1d	3d	4d	7d
South warehouse Bengaluru	4d	3d	1d	4d	7d

The figure in bold is the fastest warehouse for that zone. This one table is the whole reason allocation matters: the same order is a 1-day delivery from one warehouse and a 4-day delivery from another.

How a promise date is worked out

1

The order arrives at a time of day. Anything before **14:00** goes out the same day; after that it goes out tomorrow.

2

→ The **warehouse** is chosen — the fastest one that actually holds the pieces.

3

→ The **transit days** for that warehouse to that zone come out of the matrix above.

4

→ Promise date = dispatch date + transit days. Nobody types it, so nobody can promise Tuesday to a zone that is four days away.

5

→ Change the warehouse and the date **changes with it**, on this screen and on the customer's order at the same moment.

The single most expensive habit in order management is a promise date typed by a person who wanted the sale. Once the date is derived, the argument moves to where it belongs: which warehouse holds the stock, and whether the network can reach that zone in time.

The same order, from every warehouse — OM-7102

IF IT SHIPPED FROM	TRANSIT	CUSTOMER WOULD BE PROMISED
South warehouse	1 day	31 Jul has the stock
West warehouse	3 days	02 Aug has the stock
North warehouse	4 days	03 Aug has the stock

Order placed 29 Jul at 16:00

Cut-off 14:00 — so it dispatches 30 Jul

Going to Chennai - South

Promised today 31 Jul

Every open order against its promise

ORDER	PLACED	DISPATCHES	FROM	TRANSIT	PROMISED
OM-7103 Wholesale / B2B	26 Jul 9:00	26 Jul before cut-off	North warehouse	3d	29 Jul 2d past
OM-7110 Own website	28 Jul 10:00	28 Jul before cut-off	South warehouse	1d	29 Jul in transit, late
OM-7106 Own website	29 Jul 10:00	29 Jul before cut-off	West warehouse	1d	30 Jul 1d past
OM-7102 Marketplaces	29 Jul 16:00	30 Jul after cut-off	South warehouse	1d	31 Jul due today
OM-7105 Social & WhatsApp	30 Jul 13:00	30 Jul before cut-off	South warehouse	1d	31 Jul due today
OM-7111 Social & WhatsApp	30 Jul 11:00	30 Jul before cut-off	West warehouse	1d	31 Jul in transit
OM-7107 Marketplaces	31 Jul 9:00	31 Jul before cut-off	North warehouse	1d	01 Aug due tomorrow
OM-7109 Own website	30 Jul 15:00	31 Jul after cut-off	North warehouse	1d	01 Aug due tomorrow
OM-7108 Wholesale / B2B	30 Jul 12:00	30 Jul before cut-off	North warehouse	3d	02 Aug in 2 days
OM-7120 Own website	31 Jul 10:00	31 Jul before cut-off	West warehouse	3d	03 Aug in 3 days
OM-7101 Own website	30 Jul 11:00	30 Jul before cut-off	North warehouse	6d	05 Aug in 5 days
OM-7104 Retail counter	31 Jul 10:00	31 Jul before cut-off	—	—	no date possible cannot be promised

The transit matrix, how a date is worked out, and every open order against its promise.

The bold figure in each column is the fastest warehouse for that zone. This one table is the reason allocation matters: the same order is a one-day delivery from one warehouse and a four-day delivery from another, and no amount of good intention closes that gap.

WAITING TO BE LOOKED AT

1

refund is stuck here

REFUNDS OWED

₹7,247.50

₹0.00 already paid

The returns desk

ORDER	ITEM	WHY	PARCEL BACK?	LOOKED AT?	REFUND
OM-7116	Premium product	customer returned it	in the warehouse	not yet	4,999.00 due
Pooja Menon - Marketplaces 1 × ₹4,999.00					
OM-7117	Standard product	customer returned it	still in transit	not yet	1,799.00 due
Harsh Agarwal - Own website 1 × ₹1,799.00					
OM-7118	Accessory	refused at the door	in the warehouse	damaged	449.50 due
Lata Kulkarni - Marketplaces 1 × ₹899.00					

The order this desk works in

1

The customer returns it, or the courier could not hand it over. Either way it becomes a return — the sale leaves the order book on the spot.

2

→ Parcel is back. Until somebody marks this, the refund button does nothing at all.

3

→ Somebody looks at it. Resaleable, or damaged. Still no money out.

4

→ Refund. Full amount if it is resaleable; 50% if it came back damaged.

5

→ A resaleable piece goes back into stock at the warehouse it shipped from. A damaged one does not, because pretending otherwise is how phantom stock starts.

What a return actually costs

Value that came back	₹7,697.00
Refunds paid	₹0.00
Refunds still owed	₹7,247.50
Pieces recovered into stock	0
Written off as damaged	₹899.00

Every rupee in "refunds still owed" is money a customer is expecting and has not received. It is a real liability, worked out from parcels that exist rather than from a policy document — and it cannot be paid down by accident, because the app will not release a refund on a parcel nobody has looked at.

Parcel back, then eyes on it, then money out — in that order, every time.

The buttons on each row change as the parcel moves through: **Parcel is back** first, then **Resaleable** or **Damaged**, and only then does **Pay the refund** do anything at all.

The refund gate, refusing

It is a real liability, worked out from parcels that exist rather than from a policy document — and it cannot be paid down by accident, because the app will not release a refund on a parcel nobody has looked at.

No money out until the parcel is back

The parcel had not come back. Nothing was paid.

This is a gate rather than a warning. A warning gets clicked through on a busy afternoon by somebody trying to keep a customer happy. Here the refund simply does not move until the parcel is in and somebody has looked at it — which is the only version of a returns policy that survives a festive season.

Refunded ₹449.50 — written off

Part refund, and the piece was NOT added back to stock.

The second half of this is the important half. A damaged piece that gets added back to stock is phantom inventory: it will be promised to somebody, allocated, picked, and then not be there. Writing it off is the only honest option, and the app takes it automatically.

Wiring · Integration

Where every figure comes from

Order Management owns the order, the allocation and the promise. Stock, money and the courier it shares.

Shared Data Core: Item/SKU · Party · Stock · Ledger/Voucher · Order — every module reads and writes these.

Every figure here, and its source

FIGURE HERE	COMES FROM	HOW IT IS WORKED OUT
Order book value	This app (it owns the order)	Every live order: quantity × rate — cancellations and returns are out
Which warehouse it ships from	This app + Inventory	The fastest warehouse whose real figure covers the quantity ordered
Dispatch date	This app	Same day before the cut-off hour, the next day after it
Promise date	This app + the transit matrix	Dispatch date + that warehouse's transit days to that zone — recomputed on every read
Cannot be promised	Inventory	No warehouse holds enough; the order is shown with no date rather than a hopeful one
Stock at each warehouse	Inventory & Catalog / Warehouse	Falls where the order is allocated; comes back on a cancellation or a resaleable return
Arrived on time	This app + Logistics	Delivery date against the promise date — the promise is never re-written to match
Returns and refused deliveries	Logistics	Both become returns; a refused delivery is never counted as a delivery
Refund owed	This app	Full value if resaleable, the damaged-goods share if not — and only after the parcel is in and inspected
Refund paid	Payments	Money out, recorded against the order it belongs to
Books	Accounting	Sale on delivery, refund as a credit note, damaged stock as a write-off

Live example — one order, end to end

1

An order lands from **Own website**. It joins the one order book — not a channel-specific list.

2

-- The **fastest warehouse that actually holds the pieces** is chosen, and the stock there falls.

3

-- The **promise date** appears by itself: cut-off, then that warehouse's transit to that zone.

4

-- Packed, then **shipped** — never shipped without an allocation, so the on-time figure cannot be back-filled.

5

-- Delivered on or before the promise, or it counts against on-time. There is no third option.

6

-- If it comes back: parcel in, eyes on it, **then** money out. A resaleable piece returns to the warehouse it left.

The three things this app refuses to let happen

1

· **Nothing ships from a warehouse that does not have it.** Allocation is compulsory and is checked against the real figure at that location, so a picker is never sent to an empty shelf.

2

· **No money leaves before the goods are back and looked at.** A refund is impossible until the parcel is received *and* inspected — which is the whole difference between a returns policy and a leak.

3

· **A promise date is never typed.** It is the cut-off plus that warehouse's transit days to that zone. Change the warehouse and the date changes; nobody can promise a date the network cannot reach.

All three are self-tests, so the app tells you on startup if any of them stops being true.

Refunded ₹449.50 — written off

Every figure, its source, and one order followed from landing to refund.

Every figure, and how it is worked out

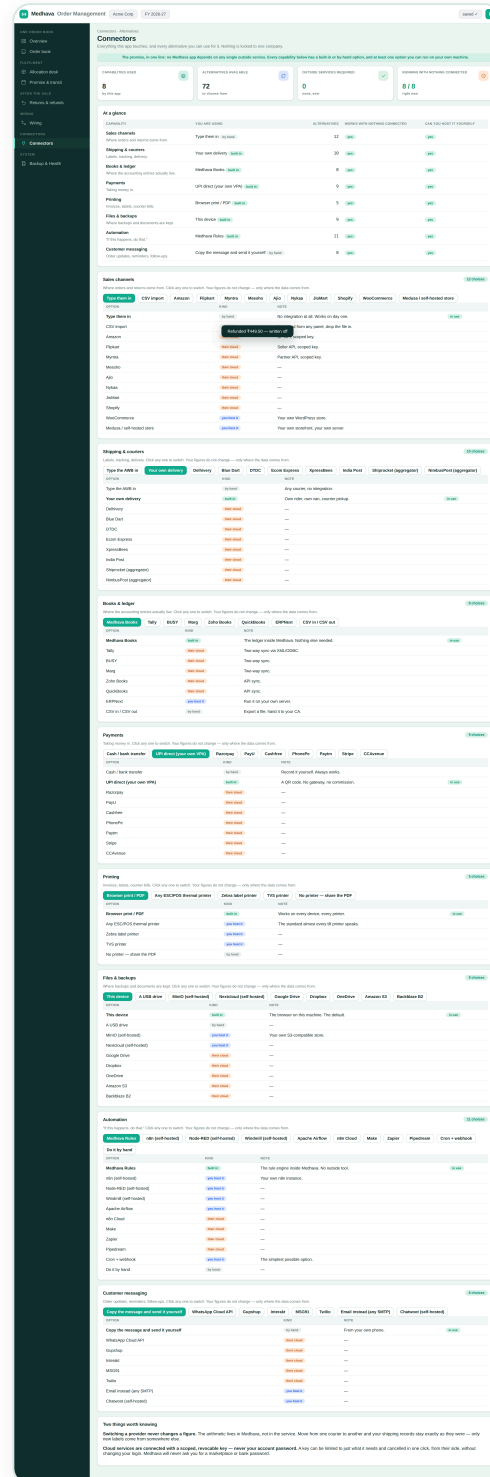

This is the same table as the Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Order book value	This app (it owns the order)	Every live order: quantity × rate — cancellations and returns are out
Which warehouse it ships from	This app + Inventory	The fastest warehouse whose real figure covers the quantity ordered
Dispatch date	This app	Same day before the cut-off hour, the next day after it
Promise date	This app + the transit matrix	Dispatch date + that warehouse's transit days to that zone — recomputed on every read
Cannot be promised	Inventory	No warehouse holds enough; the order is shown with no date rather than a hopeful one
Stock at each warehouse	Inventory & Catalog / Warehouse	Falls where the order is allocated; comes back on a cancellation or a resaleable return
Arrived on time	This app + Logistics	Delivery date against the promise date — the promise is never re-written to match
Returns and refused deliveries	Logistics	Both become returns; a refused delivery is never counted as a delivery
Refund owed	This app	Full value if resaleable, the damaged-goods share if not — and only after the parcel is in and inspected
Refund paid	Payments	Money out, recorded against the order it belongs to
Books	Accounting	Sale on delivery, refund as a credit note, damaged stock as a write-off

Every figure is rounded to two decimal places at the moment it is calculated, so a total can never disagree with the rows above it by a stray paisa.

Connectors — nothing is locked to one company

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service**. Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

"Outside services required: 0" is not a marketing line — it is one of this app's self-tests.

The three rules the app enforces on itself

- 1 No capability has only one choice.** Every one has at least three; most have eight to twelve.
- 2 Every capability has a built-in or by-hand option** — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3 Every capability has an option you can host yourself** — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

Order Management uses **8** capabilities and offers **82** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajio · Nykaa · JioMart · Shopify · WooCommerce · your own store
Shipping & couriers	Type the AWB in · your own delivery · Delhivery · Blue Dart · DTDC · Ecom · XpressBees · India Post · Shiprocket · NimbusPost
Books & ledger	Medhava Books (built in) · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext (self-hosted) · CSV to your CA
Payments & refunds	Cash · UPI direct with your own QR (no commission) · Razorpay · PayU · Cashfree · PhonePe · Paytm · Stripe · CCAvenue
Printing	Browser print / PDF · any ESC/POS thermal printer · Zebra · TVS · no printer at all
Files & backups	This device · a USB drive · MinIO or Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2
Automation	Medhava Rules (built in) · n8n · Node-RED · Windmill · Airflow (self-hosted) · n8n Cloud · Make · Zapier · Pipedream · cron + webhook · by hand
Customer messaging	Copy and send it yourself · WhatsApp Cloud API · Gupshup · Interakt · MSG91 · Twilio · email instead · Chatwoot (self-hosted)

Cloud services use a scoped, revocable key — never your password. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password.** If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 55 self-tests, in full (1 of 3)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	every order belongs to a channel that exists
✓ pass	every order is going to a zone that exists
✓ pass	every order is for an item that exists
✓ pass	every warehouse has a transit figure for every zone
✓ pass	the same zone takes a different number of days from different warehouses
✓ pass	order value = quantity × rate
✓ pass	a cancelled or returned order is in no live total
✓ pass	a return is never counted as a live order
✓ pass	channel values add up to the whole order book
✓ pass	every live order is counted once across the channels
✓ pass	an order placed before the cut-off dispatches the same day
✓ pass	an order placed after the cut-off dispatches the next day
✓ pass	promise date = dispatch date + that warehouse's transit days to that zone
✓ pass	a promise date is never earlier than the dispatch date
✓ pass	no promise date is stored anywhere — it is worked out on every read
✓ pass	an order no warehouse can serve has no promise date at all
✓ pass	changing the warehouse changes the date the customer is given
✓ pass	left alone, an order is served from the fastest warehouse that holds it
✓ pass	allocating by hand overrides the automatic choice

The 55 self-tests, in full (2 of 3)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	an order cannot be allocated to a warehouse without the stock
✓ pass	nothing can be shipped before it is allocated
✓ pass	every order already past Allocated has a warehouse against it
✓ pass	allocating takes the stock out of that warehouse and no other
✓ pass	cancelling an allocated order puts the stock back where it came from
✓ pass	a backorder is exactly an order nothing can serve
✓ pass	every backorder is raised as urgent
✓ pass	stock everywhere = the sum of the warehouses
✓ pass	stock cannot be moved into the warehouse it came out of
✓ pass	stock cannot be moved out of a warehouse that does not have it
✓ pass	moving stock changes two warehouses and leaves the total alone
✓ pass	on-time counts only orders that actually landed
✓ pass	an order is on time when it landed on or before the date promised
✓ pass	an order that landed after its promise is counted as late
✓ pass	on-time % is the share of landed orders that met their promise
✓ pass	a blown promise is an unshipped order whose date has gone
✓ pass	an order already shipped is never called a blown promise
✓ pass	a refund is impossible before the parcel is back
✓ pass	a refund is impossible before somebody has looked at it

The 55 self-tests, in full (3 of 3)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	nothing is refunded twice
✓ pass	a resaleable return refunds the whole amount
✓ pass	a damaged return refunds only 50% of the value
✓ pass	a resaleable piece goes back into stock and a damaged one does not
✓ pass	money owed = every return that has not been refunded yet
✓ pass	a parcel booked in is no longer counted as coming back
✓ pass	a parcel already looked at is not on the inspection list
✓ pass	a refused delivery is treated as a return, never as a delivery
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

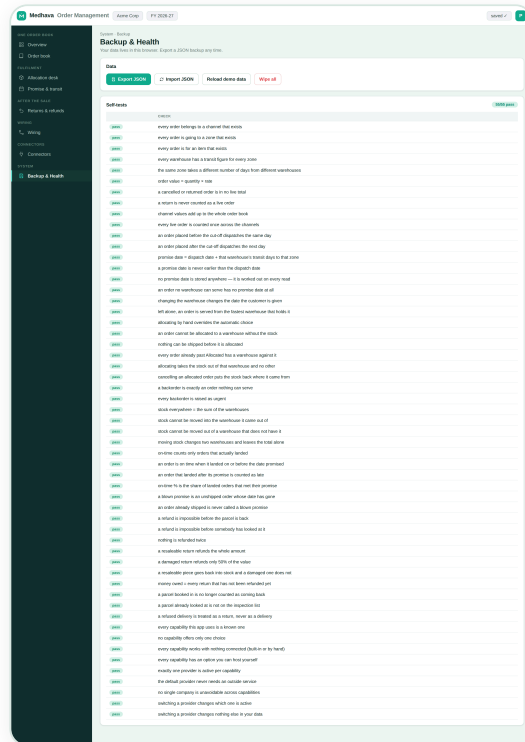

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click `Order_Management.html`. It opens in your browser. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then : → **Add to Home screen**.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Everything you enter lives in your own browser on your own device — nowhere else, and never on anybody's server. That means nobody can see it, and also that clearing your browser's site data would erase it. So: **Backup & Health** → **Export JSON**, once a week. To move to another device, take the file and the backup with you and use **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It does not book the courier or print the label — it decides which warehouse and by when, and hands that over.
- ▶ It does not split one order across two warehouses; it picks the fastest single one that can serve the whole line.
- ▶ It does not replenish stock, and it will not stop you accepting an order you cannot fulfil — it refuses to give that order a date, which is the honest half of the problem.

Accepted when: the app opens by double-click with no internet · all 55 self-tests pass · an order nothing can serve gets no date · moving stock nearer changes the promised date by itself · allocating takes stock off exactly one shelf · a refund is refused before the parcel is back and before it is inspected · a damaged return is not added back to stock · a backup exports and imports cleanly.
