

UNIFIED ERP — ANY INDUSTRY

Module 01 · All three apps in one

The whole module over one set of records — add, edit, delete, upload, download

Module 01 · Dashboard & BI — App 4 of 4

All three apps of Module 01 over one set of records — add, edit, delete, upload, and watch everything move.

- One file · opens by double-click
- Works offline — including the Excel upload
- Add · edit · delete · upload · download
- 37 / 37 self-tests pass

What this is, and what is inside

This is the CEO Dashboard, the Report Builder and Group Consolidation running over **one set of records**, with the two things none of them has: you can change the records, and you can upload a spreadsheet of them.

The CEO Dashboard, the Report Builder and Group Consolidation running on one shared set of records instead of three copies. Add a sale and the dashboard, every report and the group figures all move in the same instant, because there is only one set of numbers. Type records in, or upload an Excel or CSV file of them, or export the lot back out. This is the app to test with: anything you can do here, the three separate apps do on the same engine.

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic **37 different ways** every time it starts.

What this document covers

1. What this is, and what is inside
2. Where this app sits
3. Why this app exists
4. Screen · Records
5. Editing a row
6. Companies, edited here rather than only read
7. Screen · Upload and download
8. An upload, staged before anything is written
9. After the import — everything has already moved
10. Screen · Group figures, on the records you just changed
11. Screen · Build a report, on the same records
12. The spreadsheet engine, and why it is in the file
13. Every figure, and where it comes from
14. Connectors — nothing is locked to one company
15. The three rules the app enforces on itself
16. What this app can be wired to
17. The 37 self-tests, in full (1 of 2)
18. The 37 self-tests, in full (2 of 2)
19. How to run it, and what it will not do

Where this app sits

Every Medhava app stands on **one shared Data Core**: Item/SKU, Party, Stock, Ledger/Voucher and Order. Each module writes into it; Module 01 is the module that reads it.

What it reads, and from where

COMES FROM	WHAT IT SUPPLIES
Sales	Invoices and credit notes with their channel and company
Purchase	Supplier bills per company
Inventory	Quantity on hand, cost, reorder point
Manufacturing	Pieces produced and wages booked
Accounting & GST	Opening balances, expenses, receipts and payments
Platform	Companies, trading names and the plan you are on

All four apps of this module are built from one engine file and one screen file. Not four codebases that agree — one implementation, compiled four times. That is why the CEO Dashboard, a report and the group roll-up can never disagree about a figure, and why the fourth app in this module can honestly be all three at once.

Why this app exists

The first three apps of this module are the CEO Dashboard, the Report Builder and Group Consolidation. This is all three of them, over **one set of records** — plus the two things none of them has: **you can change the records**, and **you can upload a spreadsheet of them**.

That makes it the app to test with. Type a sale in here and watch the overview, every report and the group roll-up all move in the same instant. Not because they are kept in step — because there is only one set of numbers and one set of sums underneath all three.

Every table in the app, with add, edit and delete on each one.

Editing a row

[illegible]

Press Edit on any row and the form above fills with it. Save, or cancel.

The same rules apply to a typed row as to an uploaded one. There is one set of validation rules in the engine, used by the form and the importer alike — so a row you could not upload is a row you cannot type either, and the reason is the same sentence in both places.

What is refused, and why

WHAT YOU DID	WHAT HAPPENS
Left out something required	Refused, naming the field.
Named a company that does not exist	Refused — “ <i>add the company first</i> ”. It will not quietly create one; a typo should not become a fourth business.

Companies, edited here rather than only read

Everything in this app is one of these tables. Change anything and every screen moves with it.

Which table?

Companies 3

Trading names 3

Sales 50

Purchases 25

Running costs 45

Production 12

Stock 5

Money owed to you 4

Money you owe 4

Opening balances 3

Between your own companies 8

Every legal entity you run. Add as many as your plan allows — the software itself sets no limit.

Add a company

CODE

COMPANY NAME

TAX REGISTRATION

WHAT IT DOES

Add it

Companies

3 rows

Empty this table

CODE	COMPANY NAME	TAX REGISTRATION	WHAT IT DOES	Edit	Delete
AMF	Acme Manufacturing Pvt Ltd	27AACCA1234F3Z5	Makes and sells the main product line	Edit	Delete
AEX	Acme Exports LLP	24AAFCA9876B1Z2	Overseas orders and distribution	Edit	Delete
AWK	Acme Workshop		Does job work for the other two — it has no tax registration of its own	Edit	Delete

The company list, editable — the one thing the CEO Dashboard deliberately will not do.

In the separate CEO Dashboard the company list is read-only, on purpose. Here it is a table like any other, and the same rules still apply: a company with records against it cannot simply be removed, and a trading name still cannot be made into a company.

Everything you set up here shows up immediately on the group screens: an added company appears as a row, gets its own column in every “company by company” table, and can be picked on the company dial.

Bring your Excel or CSV in, or take everything back out. No account, no internet, no library — it is all in this file.

Bring data in

Choose an .xlsx or .csv file

Download a blank template

Column headings are matched to fields by name. In any order, ignoring case and spacing — “Net Sales”, “net_sales” and “netsales” all land in the same place. Columns we do not recognise are left alone, not treated as an error: a real export from a bank or a marketplace panel always carries columns you do not want.

Company columns accept either the code or the full name. A row naming a company that does not exist is rejected with that reason, rather than quietly creating one — a typo should not become a fourth business.

Take data out

Download everything as Excel

Download this table as CSV

Download a JSON backup

The Excel file has one sheet per table, with the same headings the importer expects — so what comes out can go straight back in. That is the test of an export worth having.

TABLE	ROWS	COLUMNS
Companies	3	Code · Company name · Tax registration · What it does
Trading names	3	Trading name · Belongs to · Used on
Sales	68	Company · Month · Channel · Gross · Returns · Units
Purchases	28	Company · Month · Supplier · Amount
Running costs	48	Company · Month · Cost head · Amount
Production	12	Company · Month · Pieces made · Wages
Stock	8	Company · Code · Item · Quantity · Reorder at · Cost each
Money owed to you	4	Company · Who owes you · Amount · Days old
Money you owe	4	Company · Who you owe · Amount · Days late
Opening balances	3	Company · Cash · Bank
Between your own companies	8	Month · Billed by · Billed to · Amount · What for

Why the spreadsheet reader is written out in this file

Every other ERP loads a spreadsheet library from somebody else's server. The day that server is slow, blocked or gone, the one button every customer presses on day one stops working — and the app was never really offline.

So the zip reader, the decompressor and the Excel parser are all here, in full, in the file you double-clicked. Turn off your internet and upload a spreadsheet: it works, because there was never anything to fetch.

It is the same rule this suite applies to books, AI, counters and payments. It would be a strange rule to hold for all of those and not for Excel.

Bring an Excel or CSV in, take everything back out. No account, no internet, no library.

How your headings are matched

Column headings are matched by name, in any order, ignoring case and spacing — **Net Sales**, **net_sales** and **netsales** all land in the same place. Columns we do not recognise are **left alone, not treated as an error**: a real export from a bank or a marketplace panel always carries columns you do not want.

A company column accepts **either the code or the full name**, because that is what a person would type.

Start with "Download a blank template". It is an Excel file with one sheet per table and exactly the headings the importer expects — so the fastest way to get your own data in is to paste it into a shape that is already right.

2 row(s) ready — check the list, then choose

Why the spreadsheet reader is written out in this file

Every other ERP loads a spreadsheet library from somebody else’s server. The day that server is slow, blocked or gone, the one button every customer presses on day one stops working — and the app was never really offline.

So the zip reader, the decompressor and the Excel parser are all here, in full, in the file you double-clicked. Turn off your internet and upload a spreadsheet: it works, because there was never anything to fetch.

It is the same rule this suite applies to books, AI, counters and payments. It would be a strange rule to hold for all of those and not for Excel.

Three rows in the file: two accepted, one refused. Nothing has been written yet.

A row that cannot be trusted is never quietly dropped and never quietly fixed. It is rejected, counted, and listed with its line number and the reason. The counts across the top always add up to what was in your file — accepted plus rejected equals the row count, and there is a self-test that says so.

Then you choose, and only then is anything written:

- ▶ Add these to what is already here — the usual choice when you are bringing in a new month.
- ▶ Replace those tables entirely — for when the spreadsheet is the truth and the app should match it.
- ▶ Cancel — nothing happened.

After the import — everything has already moved

The Overview, straight after the upload. Nothing was refreshed; there was only ever one number.

There is no "recalculate", no "sync", and no "last updated" anywhere in this app. Every figure is worked out from the records at the moment the screen is drawn. That is why an upload does not need to trigger anything — the next screen you open has already counted it.

The same upload has moved the group roll-up and every report, by the same amount, at the same instant. Those are not three systems agreeing; they are one system displayed three ways.

Group figures

Every company added together, with what they billed each other taken back out first.

PERIOD

Apr

May

Jun

Jul

Full year

One company or all of them — this screen is always all of them. Every row below is one company.

GROUP NET SALES

₹6,90,410.00

after removing internal billing

GROUP PROFIT

₹1,01,410.00

13% margin

GROUP CASH

₹9,59,230.00

across every company

GROUP STOCK

₹13,17,580.00

at cost

COMPANIES

3

2 with a registration

How the group total is arrived at

Every company's net sales, added up

₹7,71,410.00

– What your companies billed each other

₹81,000.00

= Group net sales

₹6,90,410.00

Every company's purchases, added up

₹3,43,000.00

– The same internal billing, on the buying side

₹81,000.00

= Group purchases

₹2,62,000.00

– Making / wages

₹95,000.00

– Running costs

₹2,32,000.00

= Group profit

₹1,01,410.00

Notice that the elimination appears twice and cancels itself. That is not a coincidence — an internal bill is income to one of your companies and a cost to another, so removing it changes what the group sold and never changes what the group earned.

Where the sales came from

Acme Manufacturing Pvt Ltd profit ₹73,580.00

₹3,58,730.00

Acme Exports LLP profit ₹30,313.50

₹2,49,863.50

Acme Workshop (no registration) profit ₹2,483.50

₹1,62,816.50

Sold outside the group

₹7,56,000.00

Billed between your own companies

₹81,000.00

The first line is business you won. The second is work moving inside the group. Only the first grows the business.

The group roll-up, over the same records — with internal billing still removed.

The three group rules survive everything you do here. Edit rows, upload a file, delete a table — internal billing is still removed, a company with no registration still counts and is still refused a return, and a trading name still cannot be made into a company. The end-to-end test for this module checks exactly that, after all the editing.

Save report

Saved reports remember the source, grouping, filters and sort — not the numbers. Run one next month and it recalculates on the new data.

The Report Builder, unchanged, reading the records you just uploaded.

This is the Report Builder screen, not a version of it. Same six sources, same grouping, same Top-N honesty, same saved-questions behaviour — because it is the same function in the same shared file.

Which is what makes this app worth shipping alongside the other three rather than instead of them: test here, and you have tested all three.

The spreadsheet engine, and why it is in the file

Every other ERP loads a spreadsheet library from somebody else's server. The day that server is slow, blocked or gone, the **one button every customer presses on day one** stops working — and the app was never really offline.

So this file contains the whole thing: a CRC-32, a raw DEFLATE decompressor, a zip reader and writer, the Excel sheet XML, and a CSV reader and writer. About four hundred lines. An `.xlsx` file is a zip full of XML, and now the app knows how to open one by itself.

Test it in ten seconds: turn off your WiFi, reload the page, and upload a spreadsheet. It works, because there was never anything to fetch.

It is the same rule this suite applies everywhere else. Books, AI, automation, couriers, payments — every capability has an option that needs nobody. It would be a strange rule to hold for all of those and not for the Excel button.

What comes out can go back in

Download everything as Excel writes one sheet per table, with the same headings the importer expects. That round trip is checked automatically: the export is read back and re-imported, and the test only passes if **nothing is rejected and the figures match**.

Every figure, and where it comes from

This is the same table as the app's Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Everything you type or upload	This app	Records are written once, in one place, and every screen reads them from there
Overview, Sales, Money, Stock, Alerts	Sales + Purchase + Inventory & Catalog + Manufacturing + Accounting & GST	The CEO Dashboard screens, on the records in this app
Build a report	This app + Sales	The Report Builder, reading the same records — a report can never disagree with the dashboard
Group roll-up	Platform (companies) + Accounting & GST	Group Consolidation, on the same records, with inter-company billing removed
Upload Excel or CSV	This app	Column headings are matched to fields, every row is checked, and anything rejected is shown with its reason
Download Excel or CSV	This app	Every table written back out as a sheet, ready to hand to anybody

The arithmetic of the whole module, in one place

NAME	WORKED OUT AS
Net sales	gross sales – returns
Return %	returns ÷ gross sales × 100
Gross profit	net sales – purchases – wages
Net profit	gross profit – running costs
Margin %	net profit ÷ net sales × 100
Cash + bank	opening cash + opening bank + all-time net profit
Stock value	for every item: quantity × cost, added together
Net position	cash + what you are owed – what you owe
Cost per piece	wages for the month ÷ pieces made that month
Group net sales	every company's net sales added up, – what they billed each other
Group profit	every company's profit added up. Internal billing cancels itself out

Every figure is rounded to two decimal places at the moment it is calculated, so a total can never disagree with the rows above it by a stray paisa.

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service.** Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

The three rules the app enforces on itself

- 1

No capability has only one choice. Every one has at least three; most have eight to twelve.
- 2

Every capability has a built-in or by-hand option — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3

Every capability has an option you can host yourself — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

Module 01 · All three apps in one uses **6** capabilities and offers **51** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Books & ledger	Medhava Books · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext · CSV in / CSV out
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajo · Nykaa · JioMart · Shopify · WooCommerce · Medusa / self-hosted store
Email sending	Download the PDF and email it yourself · Any SMTP server · Amazon SES · SendGrid · Postmark · Mailgun · Zoho Mail · Brevo
Files & backups	This device · A USB drive · MinIO (self-hosted) · Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2
GST & returns	Your CA files it · Medhava GST returns · GST offline utility (your own machine) · GSTN portal direct · ClearTax · Tally · BUSY · Zoho Books · Marg
Printing	Browser print / PDF · Any ESC/POS thermal printer · Zebra label printer · TVS printer · No printer — share the PDF

Cloud services use a **scoped, revocable key** — **never your password**. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password**. If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 37 self-tests, in full (1 of 2)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	the dashboard figure and the report total are the same number
✓ pass	the group total is every company added up, minus internal billing
✓ pass	a company with no tax registration is refused a return and still counts
✓ pass	adding a sale moves the dashboard
✓ pass	adding a sale moves every report by the same amount
✓ pass	adding a sale moves the group figures by the same amount
✓ pass	deleting it puts every figure back exactly
✓ pass	a row naming a company that does not exist is rejected
✓ pass	the rejection says to add the company first, rather than inventing one
✓ pass	a row with no month is rejected
✓ pass	a month that is not a month is rejected
✓ pass	a good row is accepted
✓ pass	a company can be given by its full name, not only its code
✓ pass	an import accepts the good rows
✓ pass	an import rejects the bad rows rather than dropping them
✓ pass	every rejected row carries a line number and a reason
✓ pass	accepted rows and rejected rows always add up to what was in the file
✓ pass	an imported row gets its own id, so it can be edited and deleted like any other
✓ pass	every table exports as its own sheet

The 37 self-tests, in full (2 of 2)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	the first row of every sheet is its headings
✓ pass	the sales sheet has one row per sales record, plus the headings
✓ pass	what this app exports, this app can import again with nothing rejected
✓ pass	the figures survive the round trip
✓ pass	this app carries every screen of all three apps
✓ pass	its overview is the same function the CEO Dashboard uses
✓ pass	its report builder is the same function the Report Builder uses
✓ pass	its group screen is the same function Group Consolidation uses
✓ pass	only this app can write records — it has Records and Files, the others do not
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click the `.html` file. It opens in your browser. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ⋮ → **Add to Home screen** and it behaves like any other app.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Your figures live in your own browser on your own device — nowhere else, and never on anybody's server. That means nobody can see them, and also that clearing your browser's site data would erase them. So: **Backup & Health** → **Export JSON**, once a week. To move to another device, take the file and the backup with you and use **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It is not a different product from the other three apps — it is the same engine and the same screens, plus record editing and files.
- ▶ It does not upload anything anywhere. Your spreadsheet is read on your own machine and never leaves it.
- ▶ In this single-file form it does not pull live from your other systems; the hosted version of Medhava is what connects those pipes.
- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ It will not stop you recording something silly. It checks its own arithmetic, not your judgement.

Accepted when: the app opens by double-click with no internet · all 37 self-tests show pass · typing a sale moves the dashboard, every report and the group figures by the same amount · deleting it puts all three back exactly · an uploaded workbook lands with its bad rows refused by name · a backup exports and imports cleanly.
