One stock number, not one per channel

What this is, and what is inside

A till that **cannot lie to the rest of the business**.

The price comes from the Catalog rather than from whoever is standing at the counter, so the shop cannot quietly undercut the website. The discount is capped at 50% and printed on the bill. GST is worked out on the **discounted** value, never on the gross.

Payment can be split any way the customer wants — part cash, part UPI, part on account — and **the bill will not print until the full amount is covered**.

Stock comes off the one shared number every channel reads, so selling the last piece at the counter stops the website selling it thirty seconds later.

And at close, **only the cash is expected in the drawer**. UPI and card went to the bank; an on-account bill is not money at all. So a gap is found the same day, not in a monthly audit.

Where POS sits

Every Medhava app stands on **one shared Data Core**: Item/SKU, Party, Stock, Ledger/Voucher and Order.

What it reads, and from where

COMES FROM	WHAT IT SUPPLIES
Catalog	Every item and its selling price
Inventory	The one stock number every channel shares
Payments	Whether the UPI or card payment actually landed
CRM	The customer, when a bill goes on account
Accounting	Where the sale, the GST and the till difference are posted

What this app owns: the bill, the discount applied, how it was paid, and the day's till count. **What it only reads:** the price and the stock — which is exactly why it cannot disagree with the website.

The process, end to end

Six steps, and two of them are gates: the payment must cover the bill, and the drawer must be counted.

- 1 **A piece is added.** Its price comes from the Catalog. The button greys out when the counter has none left.
- 2 **A discount is applied**, capped at 50%. GST is then worked out on the discounted value, never on the gross.
- 3 **Payment is split** however the customer wants — cash, UPI, card, on account, in any combination.
- 4 **The bill prints — but only when the full amount is covered.** Press it short and the app tells you what is still due.
- 5 **Stock falls** on the one shared number. No oversell is possible, on any channel.
- 6 **At close the drawer is counted.** Only cash is expected in it. Any difference is on screen before you go home.

Three rules that make a till trustworthy

- ▶ **The price is not typed.** It comes from the Catalog, so the counter cannot quietly undercut the website — and nobody has to police it.
- ▶ **The discount has a ceiling.** 50%, and it is printed on the bill for anybody to see. A counter that can discount without limit is a counter that leaks.
- ▶ **The drawer is counted every day.** A ₹200 gap found today is a question you can answer — which shift, which bill. The same gap found in a monthly audit is an argument nobody can settle.
- ▶ **And the payment must cover the bill.** Not a warning, a gate: the bill simply does not print until it does.

All four are self-tests, including "GST is never charged on the discount" and "counting less than expected shows short, not over".

Print the bill

Split it however the customer wants — part cash, part UPI, part on account. The bill will not print until the full amount is covered.

Discount is capped at 50%. A counter that can discount without limit is a counter that leaks.

Gross, discount, taxable, GST and total — worked out in that order.

GST is on the discounted value, not the gross. Charging tax on a price the customer is not paying is both wrong and expensive, and it is one of the commonest mistakes in hand-built billing.

Day close

Count the cash drawer. If it does not match what the bills say, you find out today — not next month.

OPENING FLOAT

₹5,000.00

in the drawer at open

CASH TAKEN

₹1,06,889.00

cash bills only

SHOULD BE IN THE DRAWER

₹1,11,889.00

float + cash taken

SHORT BY

₹1,11,888.00

against the bills

Count the drawer

Counted ₹1.00. That is ₹1,11,888.00 less than the bills say.

Count it again

Only cash is expected in the drawer. UPI and card go to the bank, and anything put on account is not money yet — which is exactly why they are listed separately.

The day, line by line

Opening float	₹5,000.00
	₹1,06,889.00
(not in the drawer)	₹6,463.00
(not in the drawer)	₹6,000.00
(not in the drawer)	₹6,968.00
Should be in the drawer	₹1,11,889.00
Actually counted	₹1.00
Over / short	-₹1,11,888.00

Why this is worth two minutes a day

Counting the drawer takes two minutes and it is the only moment in the day when the money and the paperwork are forced to agree. Skip it for a week and any gap becomes untraceable — you no longer know which day, which shift or which bill it came from.

A drawer that is short ₹200 today is a puzzle. A drawer that is short ₹6,000 at the end of the month is an argument nobody can settle.

Counted — there is a difference

The drawer counted, and the difference against what the bills say.

Only cash is expected in the drawer. That single distinction is what makes the difference figure meaningful. Count the drawer and compare it to total takings and it will never match — because most of the takings were never in the drawer.

One stock number, not one per channel

The quantity on this screen is the **same record** the website, the marketplaces and the wholesale order book all read. Sell the last piece at the counter and the website cannot sell it thirty seconds later.

Almost every oversell in a multi-channel business comes from keeping a separate stock figure per channel and reconciling them "later".

Counted — there is a difference

On hand, reorder point and sold today — on the same record every channel reads.

One stock number, not one per channel. Almost every oversell in a multi-channel business comes from keeping a separate figure per channel and reconciling "later". There is nothing to reconcile here.

Where every figure comes from

POS owns the bill and the till. Stock, price and the ledger it shares with everything else.

Shared Data Core: Item/SKU · Party · Stock · Ledger/Voucher · Order — every module reads and writes these.

Every figure here, and its source

FIGURE HERE	COMES FROM	HOW IT IS WORKED OUT
Item price	Catalog	Read from the price list. Nobody types a price at the till.
Line total	This app	Quantity × the catalog rate
Discount	This app	A percentage of gross, capped at 50%, and printed on the bill
GST	This app + tax rules	5% of the value AFTER discount — never on the gross
Bill total	This app	Taxable value + GST
Stock on the counter	Inventory	The one shared number. Falls when a bill prints, and the website reads the same figure
Cash expected in the drawer	This app	Opening float + the cash part of every bill. UPI, card and on-account are excluded
Over / short	This app	What you counted minus what should be there
On account	Accounts Receivable	Becomes a receivable against that customer — it is not money yet
Sale and GST in the books	Accounting	Posted when the bill prints

Live example — one counter sale

1

A piece is added to the cart. Its price comes from the **Catalog**, not from whoever is at the till.

2

→ A discount is applied, capped at **50%**. GST is worked out on the discounted value, never on the gross.

3

→ Payment is split however the customer wants. The bill will not print until the full amount is covered.

4

→ **Stock falls** — the same single number the website reads. No oversell is possible.

5

→ The sale and the GST post to the **books**.

6

→ At close, only the **cash** part is expected in the drawer. Anything else is flagged as not being money yet.

Three rules that make a till trustworthy

1 · The price is not typed.

It comes from the Catalog, so the counter cannot quietly undercut the website.

2 · The discount has a ceiling.

50%, and it is on the bill for anybody to see.

3 · The drawer is counted every day.

A ₹200 gap found today is a question; the same gap found in a monthly audit is an argument.

All three are self-tests. The app will tell you on startup if any of them stops being true.

Counted — there is a difference

Every figure, its source, and one counter sale followed through six consequences.

Every figure, and how it is worked out

This is the same table as the Wiring screen, so you have it on paper.

FIGURE	COMES FROM	HOW IT IS WORKED OUT
Item price	Catalog	Read from the price list. Nobody types a price at the till.
Line total	This app	Quantity × the catalog rate
Discount	This app	A percentage of gross, capped at 50%, and printed on the bill
GST	This app + tax rules	5% of the value AFTER discount — never on the gross
Bill total	This app	Taxable value + GST
Stock on the counter	Inventory	The one shared number. Falls when a bill prints, and the website reads the same figure
Cash expected in the drawer	This app	Opening float + the cash part of every bill. UPI, card and on-account are excluded
Over / short	This app	What you counted minus what should be there
On account	Accounts Receivable	Becomes a receivable against that customer — it is not money yet
Sale and GST in the books	Accounting	Posted when the bill prints

Every figure is rounded to two decimal places at the moment it is calculated, so a total can never disagree with the rows above it by a stray paisa.

Connectors — nothing is locked to one company

This is the promise, and the app checks it on itself every time it opens: **no Medhava app depends on any single outside service.** Not one accounting package, not one marketplace, not one AI company, not one automation tool, not one courier.

The screenshot displays the 'Connectors' section of the Medhava POS application. The interface is divided into several sections, each representing a different type of integration. At the top, a summary bar shows '6' connectors used, '45' alternatives available, '0' outside services required, and '6 / 6' running with nothing connected. Below this, the 'At a glance' section provides a high-level overview of the connectors. The main sections are: Payments, Printing, Barcode & scanning, Books & ledger, GST & returns, and Files & backups. Each section contains a list of connectors with their status (e.g., 'You are using', 'Alternative', 'Running with nothing connected') and a 'Can you meet it yourself?' checkbox. The 'Payments' section includes options like 'UPI direct (your own VPA)', 'Razorpay', 'PayU', 'Cashfree', 'PhonePe', 'Paytm', 'Stripe', and 'CC Avenue'. The 'Printing' section includes 'Any ESCPOS thermal printer', 'Zebra label printer', and 'TVS printer'. The 'Barcode & scanning' section includes 'Type the code', 'Phone camera', 'USB scanner', 'Bluetooth scanner', and 'Zebra / Honeywell gun'. The 'Books & ledger' section includes 'Medhava Books', 'Tally', 'BUDEV', 'Marg', 'Zoho Books', 'QuickBooks', 'ERPNext', and 'CSV in / CSV out'. The 'GST & returns' section includes 'Your CA files', 'Medhava GST returns', 'GST offline utility (your own machine)', 'GSTN portal direct', 'ClearTax', 'Tally', 'BUDEV', 'Zoho Books', and 'Marg'. The 'Files & backups' section includes 'This device', 'A USB drive', 'MIND (self-hosted)', 'Nextcloud (self-hosted)', 'Google Drive', 'Dropbox', 'OneDrive', 'Amazon S3', and 'Backblaze B2'. The interface is clean and modern, with a dark sidebar on the left containing navigation links for 'Counter', 'Today's sales', 'New order', 'Day close', 'Counter stock', 'Reports', 'Wiring', 'Connectors', 'System', and 'Backup & Health'.

"Outside services required: 0" is not a marketing line — it is one of this app's self-tests.

The three rules the app enforces on itself

- 1 **No capability has only one choice.** Every one has at least three; most have eight to twelve.
- 2 **Every capability has a built-in or by-hand option** — so the app is fully usable with **nothing connected at all**. No account anywhere, no internet, no subscription. That is how it ships, and it is the default it starts on.
- 3 **Every capability has an option you can host yourself** — so you are never forced to send your business data to somebody else's cloud, whatever the fashion of the day is.

All three appear as ordinary self-tests on the **Backup & Health** screen, in plain English, alongside the rest — so you can confirm them yourself in five seconds.

Switching a provider never changes a figure. The arithmetic lives in Medhava, not in the service. Move from one courier to another and every past shipping record stays exactly as it was — only new labels come from somewhere else. There is a self-test for exactly this: *"switching a provider changes nothing else in your data"*.

What the four tags on the screen mean

TAG	WHAT IT MEANS FOR YOU
built in	Ships inside Medhava. Needs nothing, costs nothing, works offline.
you host it	You run it on your own machine or server. Your data never leaves your control.
their cloud	Somebody else's service, connected with a scoped, revocable key.
by hand	A person does it, or a CSV goes in and out. Always available.

Why this rule exists at all. Software that can only work with one outside company is not a tool you own — it is a bet on somebody else staying cheap, staying available and staying in business. Every capability here has a way out, including a way that needs nobody.

What this app can be wired to

POS uses **6** capabilities and offers **61** alternatives across them. Every one is a button on the Connectors screen — click it and you have switched.

CAPABILITY	THE OPTIONS, IN FULL
Payments	Cash · UPI direct with your own QR (no commission) · Razorpay · PayU · Cashfree · PhonePe · Paytm · Stripe · CCAvenue
Printing	Browser print / PDF · any ESC/POS thermal printer · Zebra · TVS · no printer at all
Barcode & scanning	Type the code · phone camera · any USB scanner · Bluetooth scanner · Zebra / Honeywell gun
Books & ledger	Medhava Books (built in) · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext (self-hosted) · CSV to your CA
GST & returns	Your CA files it · Medhava GST returns (built in) · the offline utility on your own machine · GSTN portal · ClearTax · Tally · BUSY · Zoho · Marg
Files & backups	This device · a USB drive · MinIO or Nextcloud (self-hosted) · Google Drive · Dropbox · OneDrive · Amazon S3 · Backblaze B2

Cloud services use a scoped, revocable key — never your password. A key can be limited to only what it needs and cancelled in one click from the service's own side, without touching your login. **Medhava will never ask you for a marketplace, bank or account password.** If any screen ever does, it is not Medhava.

What if the tool you use is not on the list?

Then it becomes one more button. A provider is a small adapter — read from there, write to there — and the app around it does not change, because the arithmetic never lived in the provider. Adding one does not touch a single figure, a single screen or a single self-test.

WHEN A PROVIDER IS ADDED OR SWAPPED	WHAT HAPPENS
Your existing records	Untouched. Nothing is migrated, because nothing was stored in the provider.
Every figure on every screen	Identical — there is a self-test that proves this.
Your saved work and settings	Untouched.
The self-tests	Same list, same names, still passing.
What you have to relearn	Nothing. The screens do not change.

The practical version of the promise: if a service you use doubles its price, changes its terms, or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

The 33 self-tests, in full (1 of 2)

These run every time the app opens, **before** anything is shown. Menu → **Backup & Health** to see them live. They are written in plain language on purpose — you should be able to read what was checked.

RESULT	WHAT WAS CHECKED
✓ pass	a line total = quantity × rate
✓ pass	the discount comes off before GST is worked out
✓ pass	GST is never charged on the discount
✓ pass	a bill total = taxable + GST
✓ pass	no bill carries a discount over 50%
✓ pass	every bill was paid in full
✓ pass	takings = every bill added up
✓ pass	the payment methods add up to the takings
✓ pass	average bill = takings ÷ number of bills
✓ pass	only cash is expected in the drawer
✓ pass	what should be in the drawer = float + cash taken
✓ pass	UPI, card and on-account are never expected in the drawer
✓ pass	over/short is nil until the drawer is counted
✓ pass	counting the exact expected amount reconciles to nil
✓ pass	counting less than expected shows short, not over
✓ pass	every counter line has a stock number
✓ pass	no counter line has gone negative

The 33 self-tests, in full (2 of 2)

Continued. The last group are the **Connectors** checks — the ones that keep the no-lock-in promise honest.

RESULT	WHAT WAS CHECKED
✓ pass	stock on hand = what was stocked less what was sold
✓ pass	the low-stock list is only items at or below their reorder point
✓ pass	an empty cart totals nothing
✓ pass	the cart cannot promise more than the counter holds
✓ pass	a cart discount over 50% is clamped, never applied
✓ pass	still-due and change-to-give are never both above zero
✓ pass	GST collected is the sum of the GST on every bill
✓ pass	every capability this app uses is a known one
✓ pass	no capability offers only one choice
✓ pass	every capability works with nothing connected (built-in or by hand)
✓ pass	every capability has an option you can host yourself
✓ pass	exactly one provider is active per capability
✓ pass	the default provider never needs an outside service
✓ pass	no single company is unavoidable across capabilities
✓ pass	switching a provider changes which one is active
✓ pass	switching a provider changes nothing else in your data

If you ever see a red "fail", stop trusting the numbers on screen. Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

How to run it, and what it will not do

Running it

1. **Windows:** extract the ZIP, then double-click **POS.html**. It opens in your browser. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ⋮ → **Add to Home screen**.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

Keeping your data safe

Everything you enter lives in your own browser on your own device — nowhere else, and never on anybody's server. That means nobody can see it, and also that clearing your browser's site data would erase it. So: **Backup & Health** → **Export JSON**, once a week. To move to another device, take the file and the backup with you and use **Import JSON**.

Backup & Health — your data controls, and the live test results below them.

What it will not do

- ▶ It does not open a cash drawer or drive a specific printer — it prints through the browser, and any ESC/POS printer works.
- ▶ It does not handle returns at the counter; that is the Settlement module.
- ▶ It has no per-cashier login in this single-file form, so a till difference is the day's, not a person's.
- ▶ In this single-file form nothing is connected live to a payment gateway — see the Connectors screen.

Accepted when: the app opens by double-click with no internet · all 33 self-tests show pass · an out-of-stock item cannot be added · a bill will not print while money is short · billing takes the stock down and clears the cart · closing the day shows the exact over/short · a backup exports and imports cleanly.
