

UNIFIED ERP — ANY INDUSTRY

# CEO Dashboard

Did we make money · Is the cash safe · What needs me today

Module 01 · Dashboard & BI — App 1 of 2

The one screen an owner looks at each morning. Sales after returns, real profit, live cash, who owes you, what is running out, and a short list of things that need a decision — all computed from records the rest of the business already keeps.

One file · opens by double-click

Works offline

14 / 14 self-tests pass

Reads everything, writes nothing

# What this is, and what is inside

---

The CEO Dashboard is the **one screen you look at each morning**. It answers three questions and nothing else: did we make money, is the cash safe, and what needs a decision today.

You will never type a figure into it. Every number is worked out from records the rest of the business already keeps — sales, purchases, stock, wages and expenses. That is the whole idea: if a number here looks wrong, the record behind it is wrong, and the Wiring screen tells you exactly which one to go and check.

It is a single HTML file. It opens by double-click, runs with the internet switched off, saves your work in the browser, and checks its own arithmetic **14 different ways** every time it starts.

## What this document covers

1. What this is, and what is inside
2. Where the Dashboard sits — the wiring
3. The process — how a figure reaches this screen
4. Screen · Overview
5. Overview, explained card by card
6. Proof that it is live — the same screen, different month
7. Screen · Sales & Channels
8. Screen · Money
9. Screen · Stock & Making
10. Screen · Alerts — the four rules
11. What "clearing" an alert does
12. Screen · Wiring
13. Every figure and how it is worked out
14. The 14 self-tests, in full
15. Your data, backups and moving devices
16. How to run it, and what it will not do

# Where the Dashboard sits

Every Medhava app stands on **one shared Data Core**: Item/SKU, Party, Stock, Ledger/Voucher and Order. Each module writes into it; the Dashboard only ever reads from it.

Orange = what the Dashboard reads in. Green = what it gives back. It gives back only alerts and a view — never a change to your books.

**Why this matters.** A dashboard that can also change your records is a dashboard you cannot audit. This one is deliberately read-only. The single thing it stores is which alerts you have personally cleared, and that is kept separately from your data.

## What it reads, and from where

| COMES FROM     | WHAT IT SUPPLIES                                  |
|----------------|---------------------------------------------------|
| Sales & Orders | Invoices, credit notes, channel tags              |
| Purchase       | Supplier bills and payment terms                  |
| Inventory      | Quantity on hand, cost, reorder point             |
| Manufacturing  | Pieces produced and wages booked                  |
| Accounts       | Opening balances, expenses, receipts and payments |

# The process — how a figure reaches this screen

Nothing on the Dashboard is stored. Every time a screen opens, the whole chain below runs again from the raw records. This is what "live" actually means.

*The same five steps produce every single number you see.*

- 1 A record exists.** A sale is invoiced, a supplier bill is entered, stock moves, wages are booked, an expense is paid. The Dashboard is not involved — it is the other modules doing their normal work.
- 2 The period you picked decides what counts.** Choose June and only June's records are included. Choose Full year and all four months are. Balances — cash, money owed, stock — deliberately ignore this, because a balance is a position, not a period.
- 3 Everything is added up from scratch.** Not read from a stored total. This is why the figures can never drift out of step with the records underneath them.
- 4 The rules run.** Returns come off before anything is called "net". Purchases, wages and running costs come off before anything is called "profit". Four alert rules are tested against the fresh figures.
- 5 The screen is drawn.** Cards, tables, bars and the alert list — all from the numbers just calculated. Then it is thrown away and done again on the next click.

**The one rule that matters most.** Returns are taken off before anything on this screen is called "net". A channel that sells a lot and takes a lot back can never look better than a quieter channel that keeps what it sells.

# Screen - Overview

The Overview screen. Five cards, the trend on the left, what needs a decision on the right.

## Reading it in thirty seconds

- 1 Net profit** — did we earn? If it is green you are ahead; the percentage beside it tells you by how much of every rupee sold.
- 2 Cash + bank** — are we safe? A business can be profitable and still be unable to pay a bill on Friday. This is the number that answers that.
- 3 Open alerts** — what needs me? If it is zero, close the laptop. If it is not, the panel on the right already lists them, worst first, with a button that takes you to the screen where you can act.

# Overview, explained card by card

## Net sales

What you sold,  
**after returns have been taken off**  
. This is not the figure a marketplace dashboard shows you — theirs is gross.

## Net profit

What is actually left: net sales – purchases – wages – running costs. The percentage underneath is that profit as a share of net sales.

## Cash + bank

Your real position right now. It does  
**not**  
change when you switch period — a balance is a balance, not "profit for June".

## To collect

Everything customers and distributors still owe you, whatever its age.

## Open alerts

How many things need a decision. Red the moment there is one.

## Net sales by month

A bar per month with that month's profit beside it, the best month, and the four-month totals. The badge compares the newest month with the one before.

## What you can click

- **Any period button** — April, May, June, July or Full year. Every figure on every screen is recalculated.
- **"Open →" on any alert** — jumps straight to the screen where you can do something about it.
- **Any menu item** on the left, or the ☰ button on a phone.

Read it in this order: **Net profit** first (did we earn?), then **Cash + bank** (are we safe?), then **Open alerts** (what needs me?). Thirty seconds, and you know where you stand.

# Proof that it is live

This is the same screen as the previous page. Only one thing was clicked: the period changed from July to April.

April selected. Every card, both panels and the alert list have been recomputed.

## What moved, and what deliberately did not

| FIGURE              | CHANGED? | WHY                                                                                         |
|---------------------|----------|---------------------------------------------------------------------------------------------|
| Net sales           | Yes      | It is a period figure — this is what was sold in April.                                     |
| Net profit & margin | Yes      | Every line that builds it is filtered to April.                                             |
| Cash + bank         | No       | A balance is a position, not a period. "Cash for April" is not a thing.                     |
| To collect          | No       | Money owed is owed today, whichever month it arose in.                                      |
| Open alerts         | Partly   | Stock and payment alerts are about today. Return-rate alerts are recomputed for the period. |

That distinction is the difference between a dashboard you can act on and one that quietly misleads you. Most spreadsheet dashboards filter everything by the date column, which turns a bank balance into nonsense.

# Screen - Sales & Channels

This screen exists to answer one uncomfortable question: **which channel looks big but is not?**

Gross, returns, return %, net and units — for every channel, side by side.

**Read the "Return %" column first.** A channel with 14% returns on a big gross number can easily earn you less than a quiet channel with 2% returns. The table sorts by **net**, not gross, for exactly this reason. Anything at 12% or above is tagged "returns high" and raises an alert.

## The four cards

**Gross sales**

Everything sold, before returns. The flattering number — the one you are shown everywhere else.

**Returns**

What came back, and what share of gross that is. Turns red above 10%.

**Net sales**

Gross minus returns. The honest number, and the one every other screen uses.

**Units sold**

Pieces, not rupees. Useful when comparing a discount-heavy month with a full-price one.

Below the table, the same channels are drawn as bars **by net sales** — so the ranking you see with your eyes is the ranking that actually matters, not the one gross would give you.

# Screen - Money

Cash, who owes you, who you owe — and the profit worked out line by line.

## How the ageing tags work

|                       | OK / ON TIME  | OVERDUE / LATE    | CHASE NOW / VERY LATE |
|-----------------------|---------------|-------------------|-----------------------|
| Customers who owe you | Under 30 days | Over 30 days      | Over 60 days          |
| Suppliers you owe     | Not yet due   | Past its due date | Over 60 days late     |

**Net position** — cash plus what you are owed, minus what you owe — is the card to watch. Healthy profit with a negative net position means the money is sitting in somebody else's account, not yours.

**The profit build-up panel at the bottom is the most useful thing on this screen.** It shows profit line by line — net sales, minus purchases, minus wages, = gross profit, minus running costs, = net profit. Every line moves when you change the period, so you can see exactly which line is eating the margin.

# Screen - Stock & Making

What you are holding, what is running out, and what the floor produced.

The tag on the right of the stock table is the part to act on: "reorder" means at or below the reorder point — order it today. "low" means within twice the reorder point — order it this week. "ok" means leave it alone.

Cost per piece, in the production table, is the number to watch over time. If wages climb faster than pieces, every piece is costing more and the margin is shrinking quietly.

## The four cards

| CARD        | WHAT IT MEANS                               | WHAT TO DO ABOUT IT                                                                |
|-------------|---------------------------------------------|------------------------------------------------------------------------------------|
| Stock value | Everything held, valued at what it cost you | If this keeps climbing while sales do not, cash is being buried in stock.          |
| Running out | Items at or below their reorder point       | Any number above zero is a purchase list for today.                                |
| Pieces made | What the floor finished in this period      | Compare with units sold — making far more than you sell is how stock value climbs. |
| Making cost | Wages paid for that output                  | Divide by pieces made and watch the trend month to month.                          |

**Why the reorder point, and not a percentage.** A percentage of stock tells you nothing about how long it takes to replace. The reorder point is set per item, from how long your supplier takes to deliver it — so "reorder" genuinely means "order it today or you will run out".

# Screen · Alerts — the four rules

Nobody types these in. They are worked out from your live figures every time the screen opens. Exactly four rules produce every alert in the system:

- 1

**Stock at or below its reorder point.** Marked **urgent**. This is the one that costs you money silently — a stock-out stops production or loses a sale, and neither shows up in the accounts until later.
- 2

**Somebody has owed you money for more than 30 days.** Marked **watch** — or **urgent** past 60 days.
- 3

**A bill you owe has gone past its due date.** Marked **watch** — or **urgent** past 60 days late.
- 4

**A channel's return rate has reached 12% or more.** Marked **watch**. Returns at that level are usually a listing, sizing or description problem, not bad luck.

### Cleared

You have cleared 1 alert(s). They come back automatically if the situation gets worse.

Bring them all back

Alert cleared ✓

One alert cleared. The count drops, and a "Cleared" panel appears with a way to bring them all back.

**Clearing changes nothing in your business.** It only records that you have seen it. If the underlying situation gets worse — the stock falls further, the payment goes another month late — the alert comes straight back on its own. "Bring them all back" undoes every clear at once.

## Why clearing exists at all

- ▶ **An alert list you cannot tick off is an alert list you stop reading.** After a week of seeing the same four lines, your eye skips them — and then you miss the fifth.
- ▶ **Clearing is personal, not shared.** It is stored separately from your business data, so a backup restore never brings back a stale "handled" flag.
- ▶ **It cannot hide a real problem.** The alert is recalculated from live figures every single time the screen opens. Clearing suppresses one specific alert; the moment the underlying rule fires again on worse numbers, it is back.
- ▶ **The "Cleared" count on this screen** tells you how many you are currently suppressing, so nothing is hidden from you either.

# Screen · Wiring

Read this screen once and you will never wonder where a figure came from again.

Where every number comes from

The dashboard owns no data of its own. It reads the shared Data Core and shows you the result.

Shared Data Core: Item/SKU · Party · Stock · Ledger/Voucher · Order — every module reads and writes these.

Every figure on this dashboard, and its source

| FIGURE HERE               | COMES FROM                            | HOW IT IS WORKED OUT                                                                                               |
|---------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Net sales                 | Sales / Orders module                 | Every invoice added up, minus every credit note (return), for the period you picked                                |
| Return %                  | Sales returns                         | Returns + gross sales, worked out separately for each channel                                                      |
| Net profit                | Sales + Purchase + Payroll + Accounts | Net sales – purchases – making cost / wages – running expenses                                                     |
| Cash + bank               | Accounts / Ledger                     | Opening balance + everything earned or spent since — a true balance, not a period figure                           |
| To collect                | Accounts Receivable                   | Sum of unpaid customer invoices, aged by how many days old each one is                                             |
| To pay                    | Accounts Payable                      | Sum of unpaid supplier bills, showing days late or days remaining                                                  |
| Stock value               | Inventory module                      | Quantity on hand × cost price, item by item                                                                        |
| Running out               | Inventory + Item master               | Any item where quantity has fallen to or below its reorder point                                                   |
| Pieces made / making cost | Manufacturing / Production            | Output and wages booked by the production floor for the period                                                     |
| Alerts                    | All of the above                      | Rules applied on live figures — low stock, receivable over 30 days, bill past due, channel return rate 12% or more |

Live example — one sale

1

A sale is recorded in **Retail Stores**.

2

→ **Net sales** and the channel table on this dashboard move immediately.

3

→ **Stock** falls; if it crosses the reorder point an alert appears here.

4

→ **Money**: the customer balance is added to "to collect".

5

→ **Net profit** recalculates: net sales – purchases – wages – expenses.

This dashboard writes nothing

It is a **read-only view** of the business. Clearing an alert is the only thing stored, and only for you.

That is deliberate: a dashboard that can change your books is a dashboard you cannot trust.

Alert cleared ✓

Every figure on the Dashboard, its source, and how it is worked out.

Below the table it follows **one single sale** the whole way through: the sale is recorded → net sales and the channel table move → stock falls → if that crosses a reorder point an alert appears → the customer balance is added to "to collect" → net profit is recalculated. Five consequences, from one entry, with nothing typed twice.

**And the statement at the bottom of that screen is the important one:** this dashboard writes nothing. It is a read-only view of the business. Clearing an alert is the only thing it ever stores, and only for you. That is deliberate — a dashboard that can change your books is a dashboard you cannot trust.

# Every figure, and how it is worked out

This is the same table as the Wiring screen, so you have it on paper.

| FIGURE                    | COMES FROM                            | HOW IT IS WORKED OUT                                                                                               |
|---------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Net sales                 | Sales / Orders module                 | Every invoice added up, minus every credit note (return), for the period you picked                                |
| Return %                  | Sales returns                         | Returns ÷ gross sales, worked out separately for each channel                                                      |
| Net profit                | Sales + Purchase + Payroll + Accounts | Net sales – purchases – making cost / wages – running expenses                                                     |
| Cash + bank               | Accounts / Ledger                     | Opening balance + everything earned or spent since — a true balance, not a period figure                           |
| To collect                | Accounts Receivable                   | Sum of unpaid customer invoices, aged by how many days old each one is                                             |
| To pay                    | Accounts Payable                      | Sum of unpaid supplier bills, showing days late or days remaining                                                  |
| Stock value               | Inventory module                      | Quantity on hand × cost price, item by item                                                                        |
| Running out               | Inventory + Item master               | Any item where quantity has fallen to or below its reorder point                                                   |
| Pieces made / making cost | Manufacturing / Production            | Output and wages booked by the production floor for the period                                                     |
| Alerts                    | All of the above                      | Rules applied on live figures — low stock, receivable over 30 days, bill past due, channel return rate 12% or more |

## The arithmetic, in one place

| NAME           | WORKED OUT AS                                     |
|----------------|---------------------------------------------------|
| Net sales      | gross sales – returns                             |
| Return %       | returns ÷ gross sales × 100                       |
| Gross profit   | net sales – purchases – wages                     |
| Net profit     | gross profit – running costs                      |
| Margin %       | net profit ÷ net sales × 100                      |
| Cash + bank    | opening cash + opening bank + all-time net profit |
| Stock value    | for every item: quantity × cost, added together   |
| Net position   | cash + what you are owed – what you owe           |
| Cost per piece | wages for the month ÷ pieces made that month      |

Every figure is rounded to two decimal places at the moment it is calculated, so a total can never disagree with the rows above it by a stray paisa.

# The 14 self-tests, in full

These run automatically every time the app opens, **before** anything is shown. You can see the result yourself: menu → **Backup & Health**. They are written in plain language on purpose — you should be able to read what was checked.

| RESULT | WHAT WAS CHECKED                                     |
|--------|------------------------------------------------------|
| ✓ pass | net sales = gross – returns                          |
| ✓ pass | July gross sales = 676000                            |
| ✓ pass | gross profit = net sales – purchases – wages         |
| ✓ pass | net profit = gross profit – expenses                 |
| ✓ pass | channel net totals equal overall net sales           |
| ✓ pass | period filter works: months add up to all            |
| ✓ pass | switching period changes the numbers                 |
| ✓ pass | stock value = qty × cost                             |
| ✓ pass | low stock list only items at/below reorder           |
| ✓ pass | receivables total = sum of balances                  |
| ✓ pass | alerts are raised for every low-stock item           |
| ✓ pass | an overdue receivable (>30d) raises an alert         |
| ✓ pass | clearing an alert removes it                         |
| ✓ pass | cash balance is a real position, not a period figure |

**If you ever see a red "fail", stop trusting the numbers on screen.** Take a backup, reload the file, and report which line failed. Software that tells you when it is broken is worth more than software that is quietly wrong.

## Why these are written in plain English

Most software tests are written for programmers and named things like `assertNetEqualsGrossMinusReturns`. These are named so **you** can read them and judge whether the right thing was checked. If a check you care about is not in that list, it is not being checked — and that is a conversation worth having, not a detail to hide.

They also run **before** the screen is drawn, not on a schedule and not on somebody else's machine. Every launch, on your device, against your data.

# How to run it, and what it will not do

## Running it

1. **Windows:** extract the ZIP, then double-click `CEO_Dashboard.html`. It opens in your browser. That is the whole installation.
2. **Mac:** unpack the ZIP, double-click the file. Safari opens it.
3. **Android:** Files app → Downloads → tap the file → open with Chrome. Then ⋮ → **Add to Home screen** and it behaves like any other app.
4. **iPhone / iPad:** Files app → tap the file → Safari. Then Share → **Add to Home Screen**.
5. No internet needed, ever. No account, no licence key, no setup wizard.

## Keeping your data safe

Your figures live in your own browser on your own device — nowhere else, and never on anybody's server. That means nobody can see them, and also that clearing your browser's site data would erase them. So: **Backup & Health** → **Export JSON**, once a week. To move to another device, take the file and the backup with you and use **Import JSON**.

*Backup & Health — your data controls, and the live test results below them.*

## What it will not do

- ▶ It does not sync between your devices on its own — use the backup file.
- ▶ It has no user accounts or passwords. Whoever can open your device can open the app.
- ▶ In this single-file form it does not pull live from your other systems; the hosted version of Medhava is what connects those pipes.
- ▶ It will not stop you recording something silly. It checks its own arithmetic, not your judgement.

**Accepted when: the app opens by double-click with no internet · all 14 self-tests show pass · switching the period changes every figure · an alert can be cleared and brought back · a backup exports and imports cleanly.**
