

MODULE 01 OF 16

Dashboard & BI

CEO Dashboard · Report Builder

2 apps × 2 editions — Medhava (any industry) and Vastrangam

The layer that tells you what is happening. One app answers the three questions an owner asks every morning; the other lets you ask anything else. Both read the same records, apply the same rules, and can never disagree with each other.

4 working apps

114 self-tests, all passing

Zero console errors

Every screen and button verified

What this module is

Module 01 is the **seeing** layer of Medhava. It records nothing and changes nothing. It reads what every other module writes and turns it into two things: a screen that tells you where you stand, and a tool that answers any other question you have.

It is deliberately the first module built. Until you can see the business clearly, there is no way to judge whether the other fifteen modules are helping.

The two apps

APP	ANSWERS	SCREENS	SELF-TESTS
1 · CEO Dashboard	Did we make money? Is the cash safe? What needs me today?	8	23
2 · Report Builder	Everything else — asked your way, in three clicks	6	34

Two editions of each

EDITION	WHAT IT IS
Medhava	The unified ERP. Industry-neutral names and rules — the same engine runs a textile business, a medical distributor, a manufacturer or a services firm. You change the master data, not the software.
Vastrangam	The same engine with Vastrangam's own world in it: Myntra and Flipkart, Surat and Jaipur mills, silk and zari, karigar wages, BUSY. Its purpose is to prove the neutral engine survives contact with a real business.

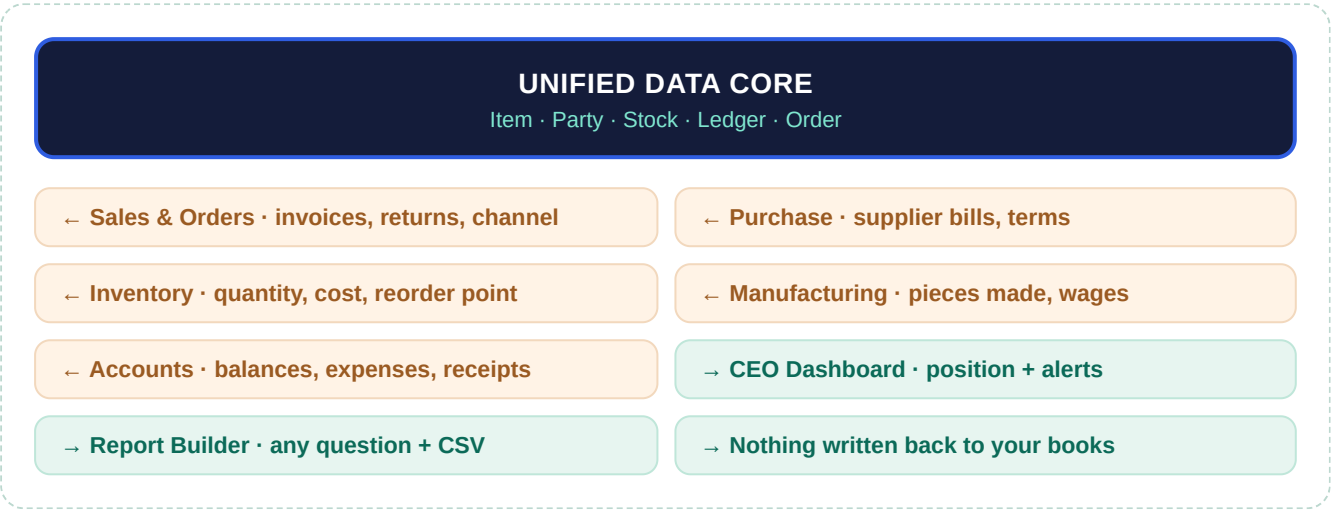

The engine is byte-for-byte identical between the two editions. Only the configuration file differs. Both editions pass exactly the same self-tests, with the same names — which is the proof that "industry-neutral" is real and not a claim.

How the two apps sit on the Data Core

Every Medhava module writes into one shared core. Module 01 is the only module that exclusively reads.

Five modules feed in. Two apps read. Nothing flows back — which is what makes the numbers auditable.

Both apps use the same five steps. That is why they cannot produce different answers.

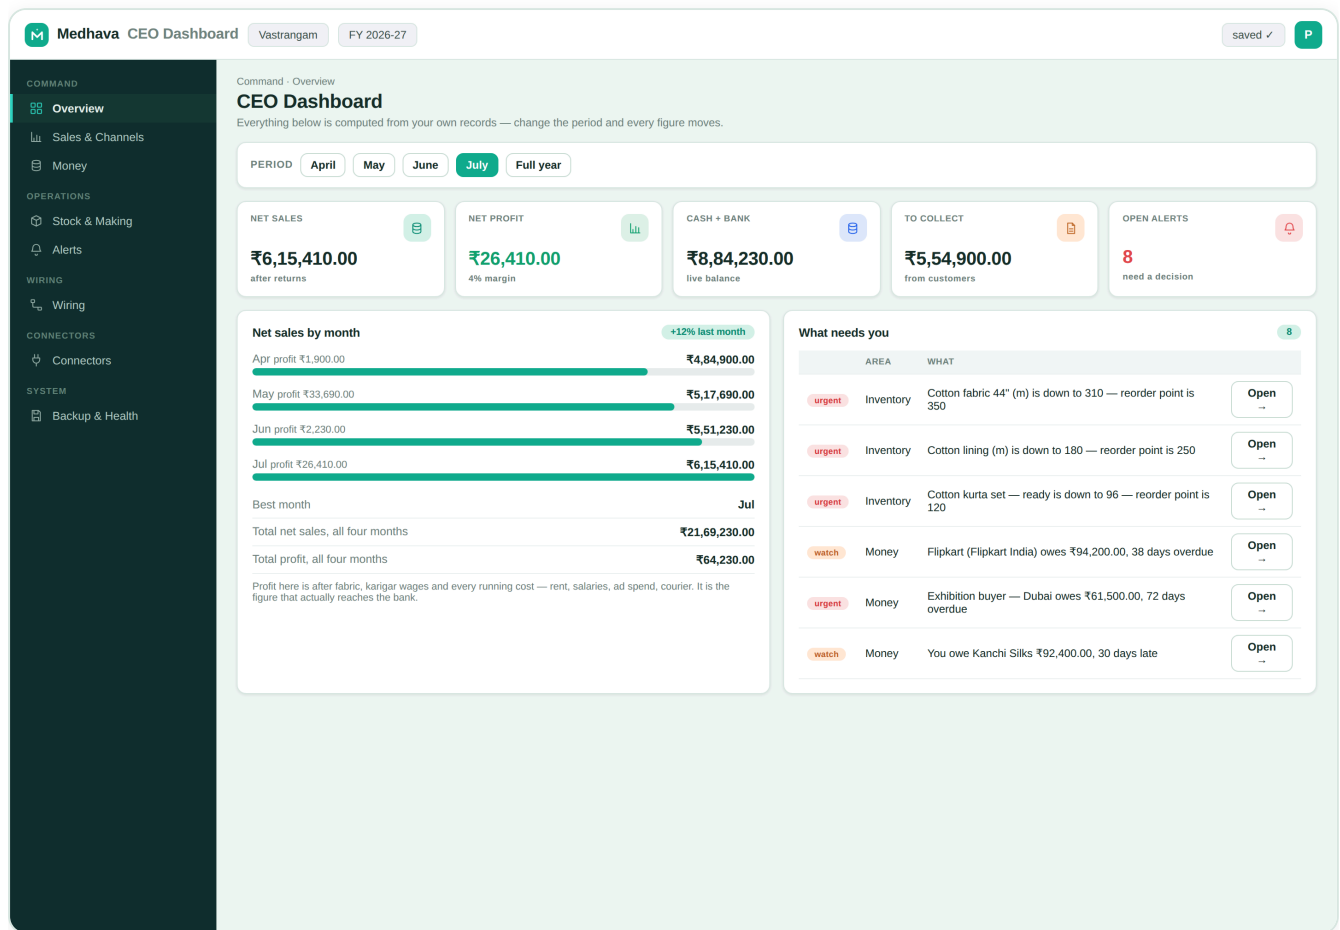

The five things the Data Core holds

ENTITY	WHAT IT IS	WHO WRITES IT
Item / SKU	One product or material, with its cost and reorder point	Catalog, Inventory, Purchase
Party	One customer, supplier or marketplace	CRM, Purchase, Channels
Stock	One quantity per item — not one per channel	Inventory, Manufacturing, Purchase
Ledger / Voucher	One money movement — sale, bill, expense, receipt	Accounting, Sales, Purchase
Order	One order in or out, with its lines and its channel	Sales, Channels, Purchase

"One business, one brain" is this table. Every other ERP problem — stock that disagrees between channels, a profit figure nobody can reproduce, a report that contradicts the dashboard — comes from having two copies of one of these five things. Medhava has one of each, and Module 01 proves it by reading them.

App 1 · CEO Dashboard

Seven screens: Overview, Sales & Channels, Money, Stock & Making, Alerts, Wiring, Backup & Health.

The Overview screen — Vastrangam edition.

- ▶ **A live period switcher** — April, May, June, July or Full year. Every figure on every screen recalculates. Balances deliberately ignore it, because a balance is a position, not a period.
- ▶ **Returns come off before anything is called "net"** — so a busy channel with high returns can never flatter the numbers.
- ▶ **Alerts nobody types in** — four rules run against live figures: stock at its reorder point, money owed over 30 days, a bill past due, a channel's return rate at 12% or more. You can clear one; it comes back on its own if the situation gets worse.
- ▶ **A Wiring screen** that names the source and the arithmetic behind every single figure.

App 2 · Report Builder

Five screens: Build a report, Ready-made, My saved reports, Wiring, Backup & Health.

Save report

Saved reports remember the source, grouping, filters and sort — not the numbers. Run one next month and it recalculates on the new data.

Three numbered steps, and the answer already waiting at the bottom.

- **Five sources** — Sales, Money owed, Stock, Running costs, Production. Group by anything, sort by anything, filter on words or numbers.
- **Nine ready-made reports**, each answering a question owners actually ask. One click loads one into the builder, already run, and from there it is yours to change.
- **Save the question, not the answer.** Run it next month and it recalculates on next month's data.
- **Top-N is honest.** Ask for the top 5 and you see five rows — but the total still counts every matching row, and says so.
- **CSV download** on every report, total row included.

Why the two apps can never disagree

This is the part most reporting tools get wrong, so it is worth being precise about.

- 1 Same records.** Neither app keeps its own copy of anything. Both read the shared Data Core at the moment the screen is drawn.
- 2 Same rules.** Returns come off before "net" in both. Rounding to two decimals happens at the same point in both. Nothing is defined twice.
- 3 Nothing is stored mid-way.** There is no cached total anywhere in either app that could drift out of step with the records beneath it.
- 4 And it is tested.** A Sales report grouped by channel with no filters must equal the Dashboard's net sales for the same period. Grouping must never change a total. Both are self-tests that run on every launch.

Try it yourself. Open the Dashboard, set the period to Full year, note Net sales. Open the Report Builder, choose Sales, group by Channel, no filters, and read the Total line. The two figures are the same, to the paisa.

Where alerts come from — one rule, one place

RULE	THRESHOLD	BECOMES URGENT AT
Stock running out	Quantity at or below the reorder point	Immediately
Money not collected	More than 30 days old	More than 60 days
Bill not paid	Past its due date	More than 60 days late
Returns too high	Channel return rate 12% or more	—

Medhava and Vastrangam, side by side

Same engine, same self-tests, same arithmetic. Only the master data differs — which is exactly the point.

	MEDHAVA (UNIFIED ERP)	VASTRANGAM
Company	Acme Corp — stands in for any business	Vastrangam — ethnic-wear D2C + marketplace
Channels	Retail Stores · Online Marketplace · Own Website · Wholesale/B2B · Export	Myntra · Flipkart · Own Website · Wholesale (Surat) · Exhibition/Exports
Items	Primary raw material · Precision component · Finished product	Banarasi silk · Cotton 44" · Zari thread · Kurta set · Saree
Customers	Northline Retail · Metro Distributors · Harbour Trading	Myntra · Flipkart · Surat Wholesale — Rajmandir · Dubai buyer
Suppliers	Alpha Industrial · Beta Components · Gamma Materials	Jagdamba Textiles · Kanchi Silks · Surat Cotton Mills · Zari Works Jaipur
Making cost	Wages booked by the production floor	Karigar wages, per piece finished
Books	Finance / Ledger	BUSY
Engine	Identical. One file, shared by both.	
Self-tests	Identical names, identical count, all passing in both.	

Why ship both? The neutral edition is what a new customer in any industry receives. The Vastrangam edition is the proof that the neutral engine survives a real business with real messiness — real return rates, real mills, real settlement delays. If a rule only works when the data is tidy, the Vastrangam build finds it first.

What "configuration, not code" means in practice

Putting Medhava into a new business is editing one file. Nothing in the engine is touched, so nothing that was tested stops being true.

YOU CHANGE	YOU DO NOT CHANGE
Company name and financial year	How net sales is calculated
Your channels — however many, whatever they are called	That returns come off before "net"
Your items, their cost and their reorder points	How stock value or the reorder rule works
Your customers and suppliers	The 30-day and 60-day ageing thresholds
The wording on the Wiring screen	Any of the 78 self-tests

Nothing in this module is locked to one company

A rule that holds across all sixteen modules, and one that every app checks on itself at every launch: **no Medhava app depends on any single outside service.**

Not one accounting package. Not one marketplace. Not one AI company. Not one automation tool. Not one courier. Not one payment gateway.

How it is enforced, rather than promised

- 1 Every app **declares the capabilities it uses** — books, channels, messaging, storage, automation, and so on. An app that does not declare them **fails its own build**; it cannot ship.
- 2 Every capability carries a list of **interchangeable providers**, each one a button on the app's **Connectors** screen. Click a different one and you have switched.
- 3 Three self-tests run in **every app, every launch**: no capability has fewer than three choices · every capability has a built-in or by-hand option · every capability has an option you can host yourself.
- 4 A fourth test proves **switching a provider changes nothing else in your data**. The arithmetic lives in Medhava, never in the service.

Some of what that means in practice

CAPABILITY	OPTIONS, INCLUDING ONES THAT NEED NOBODY
Books & ledger	Medhava Books (built in) · Tally · BUSY · Marg · Zoho Books · QuickBooks · ERPNext (self-hosted) · CSV to your CA
Sales channels	Type them in · CSV import · Amazon · Flipkart · Myntra · Meesho · Ajio · Nykaa · JioMart · Shopify · WooCommerce · your own store
AI writing	Medhava templates (no AI at all) · Ollama on your own machine · self-hosted Llama or Mistral · Claude · GPT · Gemini · DeepSeek · Groq · write it yourself
AI images	Upload your own · Stable Diffusion or Flux on your own machine · Midjourney · OpenAI · Imagen · Firefly · Canva · Medhava Image Studio
Automation	Medhava Rules (built in) · n8n · Node-RED · Windmill · Airflow (self-hosted) · n8n Cloud · Make · Zapier · Pipedream · cron + webhook · by hand
Couriers	Type the AWB in · your own delivery · Delhivery · Blue Dart · DTDC · Ecom · XpressBees · India Post · Shiprocket · NimbusPost
Payments	Cash · UPI direct with your own QR (no commission) · Razorpay · PayU · Cashfree · PhonePe · Paytm · Stripe · CCAvenue

Cloud services use a scoped, revocable key — never your account password. Medhava will never ask you for a marketplace, bank or account password. If any screen ever does, it is not Medhava.

The practical version: if a service doubles its price, changes its terms or shuts down, you click a different button. You do not change software, you do not re-enter data, and you do not lose a day.

```

Opening it

1. **Extract the outer ZIP.** On Windows: right-click → "Extract All". On Mac: double-click it.
2. **Pick your edition** — **MEDHAVA_...zip** or **VASTRANGAM_...zip**. **Extract that one too.** This step matters — running an HTML file from inside a ZIP will not save your data properly.
3. **Open the app folder** you want — **App_01_CEO_Dashboard** or **App_02_Report_Builder**. Everything for that app is in it: the app, its manual, its PDF.
4. **Double-click the .html file.** That is the entire installation. Every filename starts with MEDHAVA_ or VASTRANGAM_, so you always know which edition you have open.
5. On a phone: open the .html file with Chrome (Android) or Safari (iPhone), then use "Add to Home screen" and it behaves like any other app.

The one mistake to avoid: opening the HTML file directly from inside the ZIP. Windows unpacks it to a temporary folder that gets wiped, so your data appears to vanish. Always extract first.

How this was verified

Nothing in this module was shipped on the basis that it looked right on screen. Every build went through the same three gates.

1 The arithmetic, with no screen involved. Each app's engine was run in isolation and its self-tests executed against the seeded data. **114 tests across the four builds, all passing.**

2 Every screen and every button, in a real browser. Each build was opened in headless Chromium; every screen was visited and **every interactive control on it was clicked** — period switches, alert clears, source buttons, filters, saves, deletes, template loads. Any console error, any script error, or any screen that failed to redraw would have failed the build. **Zero errors across all four.**

3 The screenshots in this document are the real thing. Every image was captured from the shipped file at double resolution, in the state described in the caption. Nothing is a mock-up.

BUILD	SCREENS	CONTROLS CLICKED	SELF-TESTS	CONSOLE ERRORS
CEO Dashboard · Medhava	6 / 6	76	23 / 23	0
CEO Dashboard · Vastrangam	6 / 6	76	23 / 23	0
Report Builder · Medhava	4 / 4	62	34 / 34	0
Report Builder · Vastrangam	4 / 4	62	34 / 34	0

You can re-run gate 1 yourself at any time without any tools: open any app and go to **Backup & Health**. The tests ran when the app started, and the results are on that screen.

Two bugs these gates actually caught, before you saw them

- ▶ **A self-test was quietly corrupting live data.** The tests ran against your real records rather than a copy, so one test that marked a bill as paid left it paid — on every single launch. It now runs against a deep copy. Caught by comparing a screenshot against the seed data, not by a test.
- ▶ **A panel heading was escaping its own markup**, so status tags rendered as raw text on screen. Caught by the browser gate, which fails on any screen that does not draw correctly.

Both are the kind of fault that looks like nothing and quietly poisons every number downstream. That is the argument for gates rather than a final look-over.

What comes next

Module 01 is the first of sixteen. The order is deliberate: see the business first, then fix what you can see.

#	MODULE & APPS	STATUS
01	Dashboard & BI — CEO Dashboard · Report Builder	Delivered — you are holding it
02	CRM — CRM & Customer 360	Next
03	Sales — D2C Sales · B2B & Credit · Export · POS · Quotes & Proforma	
04	E-commerce / OMS — Marketplace OMS · Order Management	
05	Warehouse — Picking & Bins · Barcode Operations	
06	Logistics — Couriers & AWB	
07	Inventory & Catalog — Stock · Catalog / PIM	
08	Manufacturing — Production Orders · Karigar & Piece-rate · BOM & Consumption · Quality Control	
09	Purchase — Procurement · Vendor Management	
10	HR & Payroll — Staff & Karigar · Time-off & Advances · Appraisal & Hiring	
11	Accounting & GST — Accounting · Invoicing · Expenses · GST & Tax · Finance Reports	
12	Settlement — Reconciliation · Claims & Disputes · Returns / RMA	
13	Marketing — Social Calendar · Campaigns · Repricing Engine · Automation	
14	AI Content Engine — Content Engine	
15	Image Studio — Image Studio	
16	Video Studio — Video Studio	
—	Platform — Identity, Settings & Audit	The spine every module runs on

What stays the same in every module from here

- ▶ **One ZIP per module**, holding one ZIP per edition — MEDHAVA and VASTRANGAM — each with a folder per app inside it.
- ▶ **Every file is named by edition, module and app**, so nothing is ever ambiguous once it is extracted.
- ▶ **Every app is one HTML file**. Double-click, works offline, saves in the browser, exports a backup.
- ▶ **Every app ships a manual** written for someone who has never installed software, and an illustrated PDF built from real screenshots of the shipped file.
- ▶ **Every app carries its own self-tests** and its own Wiring screen naming the source of every figure.
- ▶ **Nothing is a mock-up**. If it is in the PDF, it is in the app, and it was clicked in a real browser before it shipped.

Module 01 is accepted when: all four apps open by double-click with no internet · all 114 self-tests pass · every screen renders and every control responds · the Report Builder's net sales total matches the CEO Dashboard's to the paisa · a backup exports and imports cleanly on both a computer and a phone.
