Purchase is live — Procurement + Vendor Management →

Run your whole business on one system

Medhava replaces the eleven tools you run today — accounting, stock, marketplace orders, manufacturing, staff and GST — with one application where every number agrees with every other one. Record a goods receipt once, and your stock, your books, your quality record and your supplier score all move in the same instant.

Start free for 30 days

Book a demo

- ✓ Free for 30 days
- ✓ No card details
- ✓ Works with the internet off
- ✓ GST, TDS & TCS ready

30

Modules, one login

165

Apps over one data core

1

Stock number for every SKU

7

Marketplaces connected

WHAT MEDHAVA IS

One application. Not eleven that talk to each other.

Every other suite sells you separate products and a sync job between them. Medhava is a single application over one set of records — so there is nothing to synchronise, and nothing to reconcile.

1

Enter it once

A goods receipt, a counter sale, a marketplace order — recorded in one place. Stock, the ledger, the quality record and the supplier scorecard all update in the same instant, because they are reading the same record.

2

Numbers that cannot disagree

One stock figure per SKU. One ledger. One order record. Not a copy per channel that somebody reconciles on Saturday. When the website says four are left, four are left.

3

Built for how India actually runs

GST with input credit on accepted goods, TDS and TCS, seven marketplaces, piece-rate and output-based wages — and apps that keep working when the internet does not.

WHAT CHANGES FOR YOU

The same day, before and after

Nothing here is a new way to run your business. It is the work you already do, arranged so that it only has to be done once.

TODAY

- ✗ Log into seven seller panels, one at a time
- ✗ Copy each order into a sheet, then into the books
- ✗ Guess which stock figure is the real one
- ✗ Learn at month-end that a supplier over-billed you
- ✗ Chase a marketplace shortfall you spotted six weeks late
- ✗ Ask three people for their file before you can see one number

WITH MEDHAHA

- ✓ One queue, sorted by whichever order is closest to being late
- ✓ The order writes itself into stock and into the ledger
- ✓ There is one stock figure, so there is nothing to choose between
- ✓ An over-billed invoice cannot be paid — the match refuses it
- ✓ Every shortfall is on a screen the day the payout lands
- ✓ Open the dashboard. It was already up to date.

Medhava at a glance

What it is	A unified ERP: 30 modules and 165 apps sharing one data core and one event bus.
Shared data core	Item/SKU · Party · Stock · Ledger & Voucher · Order — every module reads and writes these.
Key difference	Not a suite of integrated apps. One application, so there is no sync step and no duplicate master data.
Compliance	Double-entry accounting with CGST/SGST/IGST, TDS, TCS, ITC on accepted goods, GSTR-1 and GSTR-3B.
Channels	Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa, JioMart, plus the storefront platform and a self-hosted storefront platform.
Security	PostgreSQL row-level security per company; integrations use revocable scoped API keys in an AES-256-GCM vault — never account passwords.
Deployment	Hosted multi-tenant cloud, or single-file offline apps that run by double-clicking with no install.

THE PROBLEM

Your business runs on eleven tools that don't talk

Accounting in one place, stock in a spreadsheet, marketplace orders in seven seller panels, contractor wages in a notebook. Every month-end becomes an archaeology project.

Numbers that disagree

Stock says 40, the marketplace says 12, the books say something else again. Nobody knows which is right, so everyone guesses.

Work entered three times

The same invoice keyed into the seller panel, the spreadsheet and the accounting package. Three chances to be wrong.

Money quietly leaking

Over-billed purchases, unclaimed marketplace shortfalls, RTO losses — invisible until the year is over.

HOW IT WORKS

One data core. One action cascades everywhere.

Every module reads and writes the same five entities. That is the physical reason a single goods receipt can touch stock, books, quality and sourcing at the same instant.

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems increase stock by 100 and claim tax credit on 100. Medhava increases stock by 96, claims input tax credit on 96, raises a debit note for the 4 rejected, and lowers that supplier's accept rate — automatically.

Nothing derived is ever stored

Outstanding, risk, performance, ageing, profit per product — all recomputed on read. They cannot drift out of step with the documents underneath them.

Industry packs

A TRADE IS A ROW, NOT A FORK

10 SHIPPED

10 trades ship configured. The seventh is a file, not a release.

What a business calls things, the stages its work moves through, the extra fields its records need, the documents it issues and the data it starts with — all of it one configuration file. A pack may never contain code, invent a concept, extend a table that does not exist, hold money as anything but integer paise, or switch off the audit trail.

#	PACK	SECTOR	ITS WORDS FOR CUSTOMER · ORDER · WORKER	PIPELINES	DOCUMENTS
1	manufacturing	Manufacturing	buyer · sales order · operator	2	4
2	wholesale-distribution	Distribution	dealer · sales order · salesman	2	5
3	retail-ecommerce	Retail	shopper · order · associate	2	4
4	professional-services	Services	client · matter · fee-earner	1	4
5	healthcare-clinic	Healthcare	patient · appointment · clinician	2	4
6	logistics-3pl	Logistics	shipper · consignment · driver	2	5
7	hospitality-food	Hospitality	guest · ticket · crew member	2	5
8	education	Education	learner · enrolment · faculty member	2	6
9	construction	Construction	client · contract · site worker	2	6
10	field-service	Field service	customer · job · technician	2	5

The order is adoption, not taste: manufacturing is the largest ERP user base, professional services the second and the one with no stock at all, retail the largest warehouse-management segment, healthcare the fastest-growing, and transportation the most-served market among third-party logistics providers.

A walkthrough

The sections above say what Medhava is. This one follows a person through it, because "31 modules over one shared data core" is a true sentence that tells you nothing about your Tuesday.

Every screen below is a real render of the software, not an artist's impression — the same markup and the same stylesheet the product uses. The figures on them are illustrative.

Day one — from signing up to working, without a consultant

Nothing is blank when you arrive. Pick manufacturing and the system says sales order; pick professional services and the same screen says matter; pick the clinic pack and it says appointment. Same columns underneath, every time.

A day in the life — one order, followed all the way

An order arrives

MODULE 15 · E-COMMERCE / OMS

It lands in one queue with every other channel's orders, sorted by the time left on its cut-off rather than the time it arrived. The order that must leave in forty minutes is above the one that came in first and has all day.

Homeware brand · D2C

The same module, two trades. Illustrative figures.

Stock moves — everywhere at once

MODULE 03 · INVENTORY & CATALOG

One number per SKU. The unit that just sold disappears from every other channel in the same instant, which is the only way to stop the cancellation that costs you a seller rating.

The same module, 3 trades. Illustrative figures.

MODULE 10 · WAREHOUSE

A pick list in walking order, confirmed against the bin it came from. A short pick stops the pack rather than quietly reducing the order — because an order silently shipped short is a claim you will pay for later.

● ● ● Pick wave 22 · Zone A → C

● ● ● Bonded warehouse · cargo in and out

The same module, two trades. Illustrative figures.

MODULE 11 · LOGISTICS

The courier rate is checked against the packed weight before booking, and cash collected at the door stays a receivable until it is actually remitted to your bank.

● ● ● Handover · what went out against what they took

The books post themselves

MODULE 12 · ACCOUNTING & GST

Revenue and tax go through one posting engine. Entries balance or they do not post — there is no third option, and no month-end scramble to find out which.

Weeks later, the payout is checked

MODULE 14 · SETTLEMENT

What the channel said it would pay, against what arrived, line by line. A shortfall is named and claimed before the window to claim it closes.

Appearance & Localisation

Identity, Settings & Audit

Users, roles and permissions, company switching, tax and numbering setup — and an immutable record of everything that ever happened.

Ask & Print

Ask from your phone, anywhere: a ledger, a bill, today’s packing slips. It comes back as a PDF — or prints on the office printer, with nothing plugged into your phone.

WhatsApp Command Console

The shop floor does not open a laptop. A worker or a staff member sends a short message — in, out, today’s pieces, leave, an advance — and it becomes a real record: attendance with the time and place it was marked, a production report against the design, a request in the approvals queue. The end-of-day prompt asks what is still open and how long it needs, so tomorrow starts from what is actually pending rather than from memory. Marking attendance checks the phone is at the unit within the radius set for it, with a grace window; a person outside it is not refused, they are flagged for the manager, because a system that locks someone out of being paid for being early at the wrong gate has failed at its job. Every override is recorded with who made it. The words a worker types are in the language they speak, and nothing here ever asks for a password, a bank detail or a document number.

Provider Router & Cost Guard

The rule that no capability depends on one outside service, enforced at the moment it matters instead of merely promised. Every capability has an ordered fallback list ending on an option that needs nothing connected, so a courier API that stops answering at 9pm, or an AI key that hits its quota mid-catalogue, drops to the next option instead of stopping the work. A provider that keeps failing is tripped out of the list entirely and retried once after a cooldown rather than hammered; retries inside one provider wait twice as long each time. And every paid call is counted in paise against a ceiling you set — over the ceiling the paid provider is refused, not warned about, and the work completes on a free one. Because every capability is guaranteed a built-in or by-hand option, a spent budget can stop the spending without ever stopping the business.

Industry Packs

What your trade calls things, the stages your work moves through, the extra fields your records need, the documents you issue and the reference data you start with — all of it loaded as a row of configuration, never as a separate version of the software. Pick the pack that matches your trade and the whole system changes its words: the same order screen reads as a job, a matter, a consignment or an appointment, with the same columns underneath. A pack may rename what exists, add fields to tables that exist, and switch discretionary rules off; it may never invent a concept, add a field to a table that does not exist, contain any executable code, or switch off the guarantees — company scoping, the audit trail, money never being a float — because a trade may change its vocabulary and may not opt out of the things the books are trusted for. Adding a trade nobody anticipated is therefore a file somebody writes, not a release somebody ships.

Communications

WhatsApp commands and broadcasts, email and SMS, and the handful of scheduled jobs that carry a nudge to the right person without anyone remembering to send it. Every capability here has more than one interchangeable provider — none of them is ever the source of a figure the business reports.

Data Privacy & Consent

What a person’s data may be used for, captured as consent at the point it is given and honoured everywhere downstream — including the right to have it corrected or removed. Retention (how long a record is kept) and deletion (a person’s right to have their own data removed) are two different policies, tracked separately, because a rule that keeps records for the law and a request from a person to be forgotten do not resolve the same way.

Payment Data Scope

A written statement of exactly which systems ever see a card or bank credential, and which never do — because every card-capable screen in this system hands that moment to a payment provider’s own secured field and never stores or even passes the number through application code. The statement is what an auditor or a partner asks for before they will connect to this system.

Appearance & Localisation

The two settings a person notices in the first minute and nobody writes a specification for: which time zone a screen shows its dates in, and whether it is drawn light or dark. Time zone is the one that matters for correctness rather than comfort — every timestamp in this system is stored as an absolute moment, so a business working across two zones reads the same event at the right local time in both, and a working day that ends at midnight ends at midnight where the work happened.

Design & Sampling

MODULE 02

2 APPS

A style exists on paper before it exists as stock

A product moves from a first idea to something the business can actually make and sell — specification, sample rounds, costed trials and sign-off — before it is ever entered as a catalog record. Building this first means Inventory & Catalog never has to invent a style it has no real specification for.

PLM & Development

First idea to something you can actually make: specification, sample rounds, costed trials and sign-off, with every version kept. A product, a machined part, a formulation or a service package all move through stages you set yourself.

Design / IP Register

What protects a design once it exists — trademark or copyright status, the date it was first shown, and a flag the moment a near-identical listing turns up elsewhere. Every version already kept by PLM & Development gets a filed status here instead of just a date stamp, because a design with no ownership record on file is a design nobody can defend.

One number everyone trusts

The most important number in the system: one quantity per SKU, per location, per stage — read and written by every other module. And one product record that every channel lists from.

Stock

Live quantity by SKU, location and stage, with reorder alerts, batches, kits and dead-stock. Goods you still own but that sit in a channel's own warehouse are a location like any other, so consignment and sale-or-return stock is counted, valued and aged with everything else instead of disappearing off the books until it sells.

Catalog / PIM

One product record — attributes, images, HSN, MRP and the price each channel actually sells at — pushed to every marketplace and to your own storefront, and scored for each channel's rules before it lists. It also holds the two things everything downstream depends on: the code each channel knows this product by, mapped to yours, and the packed size and weight that decide the courier rate and settle every weight dispute. Every listing's state on every channel is here too — live, waiting for your approval, blocked, archived — with the quality score that decides whether anyone sees it.

Kit & Combo SKU

A sellable SKU made of component SKUs — a three-piece set sold as one listing. Selling the kit decrements each component at order time, so stock is right for every piece in the set, not just the set itself.

Master-Data Hygiene

Duplicate detection and merge across customers, vendors and designs, and a dead-stock register for what has not moved in months. Protects every downstream report from the same record existing twice under two names.

CRM

MODULE 04

5 APPS

Know every customer completely — and answer them fast

One record per customer carrying every lead, order, return, document and conversation, whichever channel it came from. Whoever picks up the next question can already see everything that came before it.

CRM & Customer 360

Documents & eSign

Helpdesk & Live Chat

Forms & Feedback (NPS)

Territories

CRM & Customer 360

Lead to won, then the full lifetime: orders, returns, value and what to offer next.

Documents & eSign

Every agreement, receipt, certificate and scan filed against the record it belongs to — an order, a party, a case, an employee — so it is found by that record instead of by remembering a folder. Send one out for signature and the signed copy files itself back.

Helpdesk & Live Chat

Questions arriving by chat, email or phone become tickets tied to the order or the account they are about, with the whole history already on the screen.

Forms & Feedback (NPS)

A short form after delivery, and the score it produces attached to the design or item it is actually about — not just the buyer — so a complaint-prone item surfaces as a pattern instead of a scatter of individual gripes.

Territories

Dividing customers and targets by region or by team, and reporting against that division. Worth having the moment there is a sales team large enough to divide and an argument about whose account something was; pointless before that. A territory is a row like anything else here, so redrawing the map is an edit rather than a migration, and last year’s figures stay readable against last year’s boundaries instead of being silently restated under the new ones.

Sales

MODULE 05

9 APPS

Every way you sell, one order book — to the doorstep

Retail counter, wholesale, export and your own website all write to the same order and draw on the same stock number. The courier side lives here too, so a sale is not finished when it is billed — it is finished when it is delivered and the COD money is in.

Customisation & Made-to-Measure

Appointment Booking

D2C Sales
Orders from your own storefront — hosted, self-hosted or custom — cart to dispatch, with loyalty and partial COD.

Export
Commercial invoice, packing list, LUT bond and IGST-refund tracking.

Quotes & Proforma
Send a quote, convert it to a confirmed order in one click.

Subscriptions
A schedule that raises its own invoice on its cycle and follows up on its own when a payment fails — for anything sold as a standing order rather than a one-off.

Appointment Booking
A slot a customer books for themselves — a fitting, a consultation, a service visit — against the real availability of whoever or whatever is needed for it. It writes to the same Calendar the rest of the business works from, so a booking taken on a website at midnight cannot collide with something already in the diary.

B2B & Credit
Wholesale orders with credit limits, tier pricing and outstanding ageing.

POS
Counter billing that draws on the same stock as your website.

Couriers & AWB
Book the shipment on the order itself, compare couriers, print the label and follow the AWB to the door.

Customisation & Made-to-Measure
The order that does not exist in the catalogue: a buyer sends reference pictures and their own measurements, a price is agreed over several messages, and the piece is made for them. All of it is one record — the references, the measurement set, every quote in the negotiation and what was finally agreed, the advance taken to start work and the balance taken before dispatch. When the order is accepted it opens a production order like any other, so a bespoke piece is costed, made, checked and posted exactly as a catalogue piece is. Two legs of money on one order is the part most systems get wrong: the advance is earned when the work starts, the balance is owed until the piece ships, and the ledger shows both separately rather than one payment appearing when the whole thing is over.

Turn what is selling into what to buy and make

Confirmed orders and demand history have to become a plan before Purchase can buy anything or Manufacturing can start anything — otherwise buying and making are both just guessing. This module sits between the two: it reads what is actually selling and what is already committed, and turns that into requirement, not the other way around.

- Demand Forecast & Signal
- Requirement Explosion (MRP run)
- Open-to-Buy / Budget Ceiling

Demand Forecast & Signal

What sold, by SKU and by period, turned into a short-term forecast — the number every requisition and every production order downstream is measured against instead of a guess.

Open-to-Buy / Budget Ceiling

A spending ceiling set per period regardless of what the demand signal suggests, so a real signal cannot on its own commit more money than the business has decided to risk this season. Every requisition the MRP run drafts is checked against what is left of the ceiling before it goes to Purchase.

Requirement Explosion (MRP run)

Confirmed demand exploded through the bill of materials into what raw material to buy and what to produce, and by when — so a purchase requisition or a production order always traces back to real demand, never to a feeling that stock is getting low.

Nothing over-billed gets paid

The buy side end to end — and the control that stops you paying for goods you rejected.

Procurement

Vendor Management

Insurance Register

Procurement

LIVE

RFQ to purchase order to goods receipt, with a strict three-way match before any bill is paid.

Insurance Register

What cover exists over stock in transit, stock in the warehouse and product liability, matched against what is actually moving through Purchase and Warehouse right now — so real value in transit is never quietly running with no cover tracked anywhere.

Vendor Management

LIVE

Vendor 360, payables, ageing, a real risk score, and sourcing that follows performance.

Know what a unit really costs to make

From material in the door to the finished unit — including what every worker earned and what each product actually cost. You define the stages, the rates and the rules; nothing here is fixed to one trade. Design and sample sign-off happen upstream now, and quality inspection and the compliance record live in their own module downstream — this module is purely the making.

Maintenance

🔑

Production Orders

Your own stages from first operation to finished goods, with work-in-progress visible at each one.

👥

Piece-rate & Contractors

Output-based pay for anyone paid by the piece rather than the hour — pooled completion, per-unit rates, rework and advances resolved into a single payout.

📦

BOM & Consumption

What each product consumes, costed at today's material rates.

🔑

Maintenance

Machines, tools and assets: what is due for service, when it was last done, what it cost, and what stopped while it was down. Planned and breakdown work against the same asset record.

Certify what was received and what was made

Quality inspection used to live buried as one step inside Manufacturing; it stands on its own here because a rejection at goods-receipt and a rejection on the production floor are the same discipline, and because the certificates a business holds — the proof it follows a standard — belong next to the inspections that back them up, not scattered across email.

Quality Control
- 📄

Certificate & Compliance Register

✓

Quality Control

Accept, reject or rework — on goods received and on goods made — with reasons that feed the supplier scorecard and the performance flags alike.

📄

Certificate & Compliance Register

Every standard the business or a vendor holds — a safety, labour or environmental certification — with its issue date, its expiry, and the audit that backs it, so a certificate about to lapse is visible before a buyer asks for it and finds it already expired. What this register tracks is what a sustainability report downstream is actually built from.

Pick right the first time — and prove what you sent

Bin-level instructions and barcode scanning, so the right item leaves the building and stock stays honest — and a recording of each parcel being packed, so an argument about what was in it is settled by footage instead of by memory.

COD Remittance
- ✓

Handover & Manifest
- 🚚

Fleet

📊 Rates & Zones

Every courier's rate card by zone, weight slab and service — so the cheapest and the fastest option for this parcel are both known before it is booked.

↩ NDR & RTO Rescue

A failed delivery worked while it can still be saved — reattempt, call, correct the address — before it becomes a return you pay for twice.

📄 COD Remittance

What the courier collected at the door against what reached your bank, parcel by parcel, with every shortfall named and aged.

✓ Handover & Manifest

What is expected out today against what the courier actually took, counted per courier and per service. The manifest to hand over, the one-time code to confirm it, and a signed record of the parcels that were left behind — so a parcel lost between your table and their van has an owner.

🚚 Fleet

Your own delivery vehicles, if you run any — what each trip cost, what is due for service, and what that adds to freight. Optional; most businesses run couriers only.

Books that always balance

A full double-entry ledger built for Indian compliance — not a tax report bolted onto a spreadsheet. Medhava keeps the books on its own: no other accounting package is required, ever.

Invoicing

Expenses

GST & Tax

ITC Reconciliation

Receivables, Payables & PDC

Fixed Assets & Depreciation

Year-End Close & Period Lock

Finance Reports

Accounting

Double-entry books where every voucher balances and the trial balance always ties.

Expenses

Spend captured by category with approvals, and bill OCR to save typing.

ITC Reconciliation

Every input credit matched against the government’s own GSTR-2A/2B before a return is filed, so a credit claimed is a credit that is actually on record.

Fixed Assets & Depreciation

The asset register with both Straight-Line and Written-Down-Value depreciation tracked side by side, and disposal posting its gain or loss straight to the books.

Finance Reports

P&L, balance sheet, and profit by channel, product and SKU.

Invoicing

GST tax invoices and receipts, totals computed from the lines to the paise. Where a channel raises its own invoice, both numbers live on the order — theirs and yours — so the panel’s paperwork and your books point at the same sale and neither has to be re-keyed to find the other.

GST & Tax

CGST, SGST, IGST, TDS, TCS, input credit, GSTR-1 and GSTR-3B — filed per registration, so a group where one company is registered and another is not files exactly what each one owes and nothing it does not.

Receivables, Payables & PDC

Payments and receipts allocated against named open invoices, and a register for post-dated cheques that posts only on the date they are realised, not the date they were written.

Year-End Close & Period Lock

Profit-and-loss accounts reset and balance-sheet accounts carry forward at year end, and a reviewed period locks against backdated edits until an admin unlocks it — an act that is itself logged.

Know what cash is coming, not just what already arrived

Accounting records what happened; this module is concerned with what happens next — how much cash is actually expected, when, and whether spend against a budget is on track before the month closes and turns the answer into history.

Cash Flow Forecast

Banking & Reconciliation

Budget vs Actual

Cash Flow Forecast

Expected receipts and expected payments laid out by week, drawn from open invoices and open bills rather than typed in by hand — so a cash shortfall is visible weeks before the date it would actually bite.

Budget vs Actual

A budget set per category and period, and actual spend from Accounting tracked against it as the period runs — not only after it closes, when the only thing left to do is explain the variance.

Banking & Reconciliation

Bank statement lines matched against the ledger’s own record of what should have moved, with anything unmatched surfaced instead of silently carried forward.

Get paid what you are owed — cycle by cycle

Matching one payout to one order line happens in OMS. This module is the level above it: the settlement cycles each panel runs, the fees it actually charged against the fees it published, and the tax it deducted on your behalf.

Claims recovered				63%

-  Payout Cycles
-  Fee & Commission Audit
-  TCS & TDS Register

 **Payout Cycles**

Every settlement cycle each panel runs — what it should pay, what actually landed in the bank, and on which day — so a late payout is visible the day it is late, not at month end.

 **TCS & TDS Register**

Every rupee the panels deducted as TCS and TDS, matched against the portal's own figures — so the credit you claim is the credit you are actually owed.

 **Fee & Commission Audit**

The rate card a channel publishes against the rate it actually charged, category by category and SKU by SKU. A silent commission increase is caught the first time it is applied — and the tier you are rated in is on the same screen, because the tier is what the rate card hangs off, and losing one quietly costs more than any single deduction.

Every marketplace and your own website, one queue

Stop logging into seven seller panels and your own store admin. Every order — Amazon, Flipkart, Meesho, Ajio, Nykaa, JioMart, Myntra, and your own storefront, a self-hosted storefront platform or custom site — lands in one pipeline, and one stock number goes back out to all of them. Then the money side closes in the same module: what each channel paid, what it kept, what came back, and what you are still owed.

Marketplace OMS

Every marketplace and every storefront in one order queue — Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa and JioMart alongside any hosted, self-hosted or custom storefront. The stages each channel really uses — to accept, to pack, ready to dispatch, handed over, in transit — with the right cut-off counting down on every order, because a quick-commerce or air-shipped order is not due at the same hour as a standard one. Priority orders first, the day grouped by product so one item is picked once instead of once per parcel.

Order Management

One pipeline from new to delivered, whether the order came from a seller panel, your own storefront site, a dealer or the counter.

Manual Data Check

Upload the sheets you already download — marketplace orders and returns, and your own counter-shop registers, one file or a whole ZIP — and read ten cross-checks back: money, month, item, state, returns, claims, ads, payouts and GST. Every figure is clickable down to the transactions behind it, and the whole result downloads as Excel.

Reconciliation

Match every marketplace payout to the order line that earned it, and expose the gap.

Claims & Disputes

Turn shortfalls, weight disputes and lost parcels into filed claims with evidence — and answer them before the clock runs out. A claim that is awaiting your response is worth money; one closed for no response is worth nothing, so the days remaining sit on the screen next to the amount.

Returns / RMA

Customer, courier and wrong returns — and the dead stock they actually cost you.

Channels & Storefronts

Connect a channel once and it stays in step: catalogue out, price out, stock out, orders in. Seven marketplaces and any website platform — any hosted, self-hosted or custom site over its own API — each switchable without touching your data. Shopsy and any other storefront a channel runs alongside its main one counts as its own channel here. Where a channel has no open interface, its own downloaded report is a first-class way in. A channel may also know you by a different trading name — that is a label on the channel, not a second company, so it tags the order and the payout without ever splitting your books.

Labels & Documents

The channel gives you a PDF; this turns it into something a packer can work from. Cropped to your label size, your own product code printed large where the channel left it off, the invoice and the packing slip merged behind it, and the whole batch sent to the label printer in one job. Reprint a single parcel without redoing the batch — and nothing is ever uploaded to an outside website to be cropped.

Listing & Catalog Manager

Bulk-create and bulk-edit listings across every channel from the one product record in Inventory & Catalog, and catch the mismatches that quietly cost sales: listed but out of stock, or in stock but never listed.

Size / Fit Recommendation AI

A fit suggestion at the point of purchase, built from the item's own measurements and the return history of buyers who picked each size — aimed straight at the return reason that costs the most: the right item in the wrong size.

AR / Virtual Try-On

A way to see drape, fit and colour on a screen before buying, for items where a flat photo alone leaves too much to guess.

HR & Payroll

MODULE 16

6 APPS

Pay people right, on time

Salaries and output-based earnings in one register, with attendance driving both — whether people are on a monthly wage, an hourly rate or paid by what they finish.

Staff & Contractors

Time-off & Advances

Appraisal & Hiring

Recruitment

Payout Execution

Employee Engagement & Surveys

Staff & Contractors

Attendance, effective-dated salary and output-based earnings in a single register, whoever is on it.

Appraisal & Hiring

Performance reviews and a hiring pipeline that ends in an employee record.

Payout Execution

Where the calculation in the earnings register actually turns into money leaving the business — bank batch, UPI, cash against a signed receipt — with the method and the reference recorded against every payout, so the register's total and the money that actually moved can always be checked against each other.

Time-off & Advances

Leave, festival advances, and exactly how they change this month's payout.

Recruitment

The pipeline before someone becomes an employee — an opening, the people who applied for it, a trial piece where the work itself is the interview, and the decision with its reason kept. It matters more in a skilled trade than in most: a person is taken on for skill at one particular kind of work, and the trial output is the evidence, so it is recorded against that work and the rate that would apply rather than remembered as an impression. A candidate who is not taken on now stays findable when the same skill is needed in a busy month, and their personal documents are held under the same consent and retention rules as anyone else's, not in a folder on somebody's phone.

Employee Engagement & Surveys

Asking the people who work here how it is going, and keeping the answers where a pattern can be seen rather than in one manager's memory. Anonymity has to be real to be worth anything: a survey that quietly identifies its respondents produces polite answers and no information, so where a response is promised anonymous it is stored unlinked from the person, and the system cannot re-join them afterwards even for an administrator.

Sell more without discounting

Plan content, run campaigns, and let rules keep your prices competitive while protecting margin.

📧

Social Engagement & Inbox

📅

Social Calendar

Plan and publish across every channel from one calendar.

📊

Repricing Engine

Rules per channel and SKU — floor, ceiling, match-lowest, festival overrides — and what each change actually did. A price that went up and took the orders down with it shows as exactly that, next to the rule that raised it, so the rule can be reversed on evidence rather than on a feeling.

📄

Blog & Pages

Articles, landing pages and category copy written, scheduled and published straight to your own site — any hosted, self-hosted or custom storefront — with the meta title, description and internal links set before it goes out.

🌐

Website & Page Builder

The storefront itself, built by dragging sections into place rather than by editing a theme file — hero, product grid, size guide, lookbook, contact form — each block reading live from the catalogue, so a price or a stock state on a landing page is the same number the order screen uses instead of a figure someone pasted in and forgot. Blog & Pages above writes articles into a site that already exists; this is for the businesses that do not have one, and it is the gap that shows up plainly when this module list is set beside a mature open-source ERP: they ship a full site builder next to the blog, and until now this did not.

✉️

Campaigns

Email, SMS and WhatsApp campaigns measured on real revenue, not opens.

⚡

Automation

If this happens, do that — across any module, without writing code.

📅

Events

Trade shows and exhibitions worked as a channel of their own — booth, budget and every lead captured on the floor landing straight in CRM instead of on a stack of business cards.

📊

Markdown / Clearance Optimization

The same rule engine that reprices for competitiveness, aimed at ageing stock instead: when to start discounting it and by how much, before it becomes a warehouse write-off rather than a sale at a lower margin.

Social Engagement & Inbox

The replies, comments and messages that arrive on the accounts the business posts from, in one queue rather than four apps on somebody's phone. Distinct from the Social Calendar, which decides what goes out: this is what comes back, and it is where a complaint first appears in public. A message here can become a Helpdesk ticket with the thread already attached, so a public question and a private one end up in the same place.

AI Content Engine

MODULE 18

8 APPS

Write it, shoot it, cut it — from the catalogue you already have

Listings, ads, email, product photography and reels, all generated from your own catalogue — so the words match the product and the picture is the right size for the channel it is going to. Words, images and video sit in one module because they are one job.

Image Generation Slot

Publisher

Content Engine

Fourteen stages in your own voice, from buyer research and competitor reading through hooks, channel-ready listings, ads, social posts, video scripts, song lyrics, the publishing calendar and alt text — each written from your own catalogue, so the words match the thing.

Video Studio

Text and image to video, reels and ad cuts sized for every channel.

Image Studio

Layers, free transform, background removal, channel presets and SEO alt text — a phone photo becomes a channel-compliant product image.

Design Studio

A full design surface — templates, layers, undo and redo, any colour, exact sizing, background images and stock elements — exporting PNG, JPG or PDF at whatever size the channel or the printer asks for.

Motion Renderer

A reel rendered from a page of HTML and CSS — the same layers, fonts and brand colours the Design Studio already uses — into a real MP4, on this machine, with nothing uploaded. It is not a screen recording: the clock is faked, the animation is seeked to the exact instant of each frame, and only then is that frame captured, so the render does not care whether the machine was busy. Rendering the same festival banner twice produces the same file to the byte, which is what makes a reel something you can check and re-cut rather than something you have to watch all the way through and hope about.

Image Generation Slot

Generated imagery — a model on a background you do not have to shoot, a festival backdrop, a lifestyle scene — as a capability with interchangeable providers rather than a bet on one service: a queue of jobs, a preview while it works, inpainting to fix one region, upscaling and face correction. This one needs a graphics card. Image models cannot run on an ordinary office machine or on the container this system is built in, so what ships is the queue, the review screen and the provider slot, with the generating itself done by whichever engine you point it at — your own GPU box, or a cloud service, swapped without touching anything else. Said plainly here because the alternative is a screen that looks finished and produces nothing.

Narration Studio

A voice over the reel, in the language the buyer actually speaks — the same script the Content Engine wrote, spoken. The default needs nothing installed and no key, because every modern browser can already speak; a self-hosted or cloud voice sits behind it as an interchangeable provider for anyone who wants a cloned or branded one. Long scripts are split at sentence boundaries and rejoined, so a two-minute description is not cut off at whatever limit a service imposes. A voice cloned from a real person is only ever used with that person’s recorded consent, filed against them in Data Privacy & Consent like any other permission.

Publisher

One push sends the finished listing, picture and copy everywhere it has to appear — your storefront, each marketplace, each social account — and reports back what actually went live and what was rejected, with the reason.

Be found by a search box, an answer box and an AI

Content already exists once this module is reached; here it is made findable — by a traditional search engine, by the answer box above the results, and by the AI assistants now answering shopping questions directly instead of sending someone to a results page.

Technical SEO & Schema

Structured data, sitemaps and page-level technical checks against your own storefront and content pages, so a search engine can read what a page is actually about instead of guessing from the text alone.

Answer-Engine Optimization

Content shaped to be quoted directly by an answer box or a voice assistant — a clear, citable answer near the top of the page — rather than written only for a person to scroll through.

AI-Engine Visibility Tracking

Whether and how this business is actually cited when someone asks an AI assistant a shopping question in this category, tracked over time — the same discipline as rank tracking, aimed at a newer kind of result page.

Projects & Collaboration

MODULE 20

7 APPS

The work that is not an order — and the talking around it

Not every business runs on orders. A law firm runs on cases, an agency on engagements, a workshop on jobs, a builder on sites. This module holds that work on the same records as everything else, so the time, the cost, the documents and the decisions attached to it end up in the books rather than in somebody’s inbox.

Projects & Cases

A project, a case file, an engagement or a job — whatever your work is called. Stages you define, owners, deadlines, documents, billable time and real cost, all on one record the ledger can see.

Approvals

One queue for everything waiting on a yes — a purchase order, a discount, a leave day, a credit note, a payment. The rule that sent it there is on the screen next to it, and the decision goes to the audit record.

Automation Studio

The place a person builds “when this happens, do that” by dragging it out and watching it run — a trigger, the steps after it, a branch where the answer decides which way to go — over the same event stream every module already writes to. Marketing’s Automation aims that idea at campaigns; this is the general one, reaching any module: a payment marked short holds the next dispatch and opens a claim, a worker’s pooled output crossing a threshold raises the payout for approval, a return marked damaged writes off the piece and messages the buyer. Every run is kept — what fired it, each step, what each step returned — because an automation nobody can inspect afterwards is a rule the business cannot trust with its money.

Knowledge Base

A searchable internal wiki of standard operating procedures, scoped to the role it applies to, so how a task is meant to be done is written down once instead of carried in one person’s head.

Timesheets & Planning

Who is on what this week, and the hours that actually went in — against a project, a case, a job or a machine. Billable and non-billable separated, so a rate card turns straight into an invoice and a real cost.

Forum

Questions and answers that outlive a chat — for customers, dealers or staff — with the useful ones kept where the next person will actually find them.

Discuss

Conversation attached to the record it is about: this order, this bill, this case. A year later the reason for a decision is still sitting next to the decision.

Dashboard & BI

MODULE 21

9 APPS

See the whole business without asking anyone

Every number in Medhava rolls up here as work happens — no exports, no waiting for month-end, no asking three people for their sheet. It is the last module built for a reason: it has nothing to show until the other twenty are producing real records for it to read.

CEO Dashboard

Report Builder

Group Consolidation

Excel Dashboard Builder

ESG / Sustainability Reporting

Data Warehouse

Pipelines & Enrichment

Maps & Geospatial Views

Embedded Analytics

CEO Dashboard

Cash, sales, stock, profit and alerts on one screen, refreshed as work happens.

Group Consolidation

Several companies, one set of figures — sales, cash, stock and profit rolled up across every company you run, inter-company entries removed, with years of history to compare against. Add a company whenever the business grows one; nothing in the software caps the number, only the plan does. And a company with no tax registration of its own — a job-work arm, a new venture not yet registered — is a company like any other here, kept in the group figures without being dragged into a return it does not belong in.

Report Builder

Drag the fields you want into a report and save it for the whole team.

Excel Dashboard Builder

A full workbook — financial summary, HR, purchase, sales, inventory and production, GST, expenses — generated from the live records behind every other screen, with each company shown as its own row and a consolidated row that is a formula over them, never a separately typed total.

ESG / Sustainability Reporting

Water usage, chemical compliance, waste and packaging, reported from the same certificate and audit records Quality & Compliance already keeps — so a sustainability report is a query over evidence already on file, not a separate exercise assembled once a year from scratch.

Pipelines & Enrichment

The scheduled movement of data into that shape, and the step that fills in what a record was missing from somewhere else. Enrichment is the part that needs care: a field filled in from an outside source has to stay visibly different from one the business entered itself, or a guess quietly becomes a fact in next quarter's report.

Embedded Analytics

A report placed inside another screen, or inside somebody else's system, rather than opened from the reports list. It reads through the same permissions as everything else, so an embedded view can never show a viewer more than they could have seen by opening the report directly — which is the mistake that makes embedding dangerous when it is bolted on afterwards.

Data Warehouse

Somewhere shaped for asking questions rather than for recording transactions. Honestly premature: a warehouse is what a business builds when queries against the live records start hurting, and nothing here has ever run at a volume that could hurt. It is named so the specification has a home for it, and ranked as what it is.

Maps & Geospatial Views

Figures drawn on a map instead of in a column, for the questions that are actually about geography — where the orders come from, where the returns concentrate, which routes cost what. One visualisation type among many, listed separately in the specification and kept separate here because it needs location on the records before it can show anything at all.

AI Assistant, Agents & Automation

MODULE 22

7 APPS

Ask the business a question — and let the routine work run itself

Last for the same reason Dashboard & BI is late: something that answers questions about the whole business can only be built once the whole business is in one place. Three different things live here and the difference between them matters. An ASSISTANT answers a question you asked, from the records, with the records attached. A CHATBOT holds the same conversation with your customer instead of you. An AGENT is given a job rather than a question and works out the steps itself. That last one is what separates this module from Automation Studio in Module 20, where a person draws the steps in advance and the rule runs the same way every time; and from Automation in Module 17, which fires marketing campaigns and nothing else. Both of those stay exactly as they are — this module sits above them and calls them, rather than replacing either. Module 18 writes content; this module answers and acts.

AI Assistant

AI Chatbot

AI Agents

Agent Guardrails & Run Log

Knowledge & Retrieval

Voice In and Out

Corrections & What It Has Learned

AI Assistant

Ask in your own words — “what did Myntra actually pay us last week, and what is still short?” — and get the answer with the rows it came from sitting underneath it, each one clicking through to the record. It reads the ledger, the stock table and the settlement lines the same way a report does, so the figure it gives is the figure the books give. When it cannot find the answer it says so and shows what it looked at; it never estimates a number and presents it as a fact, because a plausible wrong figure is far more expensive than an honest blank. It answers only from records the person asking is already allowed to open, so it can never become a way around permissions.

AI Agents

A job rather than a question: “chase every unreconciled settlement line from last week and draft the claim for each.” The agent works out the steps, does them, and stops at the point where a person has to decide. It runs inside a scope you set — which records it may read, which it may write, and how much it may spend through the Module 01 Provider Router — and it cannot quietly widen that scope mid-run. Anything that moves money, files a claim, changes a price or sends a customer a message waits for a human yes.

AI Chatbot

The same engine turned to face the customer, on your own storefront and on WhatsApp: where is my order, will this size fit me, I want to return this. It reads the real order and the real size chart rather than a script written six months ago, and it will say “let me get someone” instead of guessing at anything about money, a refund or a complaint. The handover goes into the Module 04 Helpdesk queue with the whole conversation already attached, so the person picking it up starts where the customer left off instead of asking them to explain again. It never asks a customer for a card number, a bank detail or a password — that promise does not get a chatbot-shaped exception.

Agent Guardrails & Run Log

What each agent is allowed to touch, written down as a scope rather than trusted to a prompt, and every run recorded step by step: what started it, what it read, what it proposed, what a person approved, what it actually changed. Kept in the same audit trail as everything else, with the same absence of an off switch. An agent whose working nobody can inspect afterwards is not a colleague, it is an unexplained entry in the books.

Knowledge & Retrieval

The index that makes the answers grounded: your own designs, rate cards, settlement files, standard procedures and past decisions, searchable so a reply quotes what is actually on file instead of what a model remembers about the trade in general. Permission-scoped at the row, so two people asking the same question get answers drawn only from what each of them may already see.

Voice In and Out

The same assistant asked out loud and answering out loud, because the people who most need a figure are often holding something in both hands. A question spoken in the language the speaker actually uses becomes the same query the typed assistant would have run, and the answer comes back as speech with the rows still attached for anyone who wants to look at them. It refuses exactly what the typed one refuses: it will not read out a figure it could not find, and it will not take a password, a card number or a bank detail by voice — a spoken channel does not get an exception to a promise the rest of the system keeps.

Corrections & What It Has Learned

When the assistant gets something wrong, the correction is a record rather than a conversation that scrolls away. Somebody says what the right answer was, that sits against the question it belongs to, and the next person asking gets the corrected version with a note of who corrected it and when. The whole list is readable and editable by the business — not a hidden memory quietly steering answers — so a correction made in haste can be found and undone. Nothing here changes the model; it changes what the model is shown, which is the only kind of learning anybody can audit afterwards.

Developer Platform

MODULE 23

9 APPS

Let other software talk to this one — and build on it

One decision, not twenty-five: whether anything outside this system may call it. Twenty-five lines of the specification are that single capability written out from four different places, which is why it stands as a module instead of a feature buried in Platform. A versioned surface with keys and rate limits, webhooks going out, functions running on top, and only then a builder that lets somebody assemble a screen without writing code. The order matters, because a builder over nothing is a demonstration. The sign-on model has to be settled before any of it: changing how a caller proves who it is afterwards means reissuing every credential ever handed out.

Robotic Process Automation

API & Access Keys

A versioned surface over the records this system already keeps, with a key per caller, a rate limit per key, and a log of what each one asked for. Versioned from the first release rather than the third, because the moment an outside system depends on a response shape, changing it silently breaks somebody else's software at a time nobody chose. A key is scoped to exactly the records its holder may already read, so this can never become a way around the permissions every screen obeys.

Functions & Scripting

Small pieces of logic that run inside the system — when a record changes, on a schedule, or when an automation calls them. Each runs with a time limit, a memory limit and the permissions of whoever or whatever triggered it, so a script can never read what its author could not. What a function did lands in the same audit trail as everything else.

Builder Data Model

The tables and relationships a built application stands on: what a record is, which other records it points at, and which fields may not be empty. Kept separate from the builder because the data model is the expensive half to change later — a screen can be redrawn in an afternoon, a relationship that was wrong has to be migrated with all the rows already sitting in it.

Versions retired without an announced date

0%

Webhooks

The other direction: this system calling out when something happens rather than waiting to be asked. A subscription names the event and the address to post to, deliveries are signed so the receiver can tell a real call from a forged one, and a failed delivery is retried on a widening interval and then parked where somebody can see it instead of being dropped. Every attempt is recorded, because an integration that silently stopped firing is worse than one that never worked at all.

Low-code App Builder

Assemble a screen and the record behind it by dragging fields rather than writing code, for the cases a trade needs and nobody anticipated. What it produces is a configuration row, exactly as an industry pack is, and never a separate copy of the software — so an assembled screen still obeys company scoping, the audit trail and every guarantee the rest of the system makes.

App Versioning & Release

A built application has versions, somewhere to try one before it goes live, and a way back. Without this the person who assembled a screen is editing the live system at the exact moment they are still learning it, which is how a business loses a day of entries.

Developer Console

One place to see what the platform is doing for a given caller: keys issued, calls made, webhooks delivered or failed, functions run, and what each one cost. Somebody debugging an integration at two in the morning should not have to ask a person for a log.

Robotic Process Automation

Driving another system that offers no interface of its own by working its screens the way a person would. It is the least reliable way to connect anything, and worth having only when the alternative is somebody retyping figures every morning — so it is recorded here as a last resort with a run log proving what it actually did, never presented as equivalent to a real connection.

App Marketplace

A directory of applications built on this platform that a business can install into its own company, with what each one may read and write shown before installation rather than discovered after it. Nothing installs without somebody first seeing the scope it is asking for.

Agile & Sprints

MODULE 24

4 APPS

Plan work in iterations, and see what actually got done

Thirteen lines of the specification that amount to one board, one boundary and one chart. It sits beside Projects & Collaboration rather than inside it because a task list and a sprint are different disciplines: a task is either done or not, while a sprint asks how much a team reliably finishes in a fixed period and holds that answer against the last one. A business running a factory may never want any of this, which is precisely why it is a module that can be left switched off instead of something bolted onto the task list everybody uses.

- Release Planning

Product Backlog & Stories

The queue of work that has not been started, written as something a person wants rather than a task somebody was handed, grouped under the larger outcome it belongs to and sized relative to the others. Sizing is deliberately relative and not in hours, because the one thing teams estimate consistently is whether a piece is bigger than another piece.

Velocity & Burndown

How much this team actually finishes per period, and how the current one is tracking against what remains. Both are read from the board rather than typed by anybody, which matters because a progress figure a person types is a figure a person can round.

Mid-sprint additions shown as additions

100%

100%

Sprints & Boards

A fixed period with a set of work committed to it, and a board showing where each piece has got to. The boundary is the point: work added midway is visible as having been added midway, so the difference between what was planned and what was delivered stays legible instead of being quietly absorbed. Planning at the start and a review at the end are part of the same record, not meetings held somewhere else.

Release Planning

Which finished work goes out together and when, drawn from what the sprints have actually completed rather than from what was hoped for at the start. A release date derived from delivered work is the only kind that survives contact with the second sprint.

Meetings

MODULE 25

4 APPS

Who is invited, who came, and what was decided

The half of meetings that is not live video: who is invited, when it is, who attended, what was decided, and a poll or a question queue while it runs. The video itself needs media servers, bandwidth and relays, which a business rents rather than builds, so it is recorded as a constraint instead of a module. Separating the two is the whole idea — the useful and durable half does not need the expensive half, and a decision nobody wrote down is lost whether or not the call was recorded.

- Call & Meeting Analytics

Meeting Scheduling

Proposing a time, holding the slot, and letting people say whether it works before it is fixed. It reads the same availability the Calendar module keeps, so a meeting cannot be booked into a time the system already knows is taken.

Participants, Co-hosts & Moderators

Who is invited, who may run the session, and who may quiet it down. Three separate roles rather than one, because the person who owns the meeting is often not the person who should be managing a room of forty people while also presenting to them.

Polls & Q&A

A question put to everyone with the answers counted, and a queue of questions from the floor that can be ordered by how many people want the same one asked. Both outlive the call: the result is attached to the meeting record rather than disappearing when the window closes.

Call & Meeting Analytics

The record of contact — that a call or a meeting happened, with whom, about which account, and what came out of it — filed against the customer or the project it concerned. This is the half with lasting value: six months later nobody needs the recording, they need to know what was agreed and by whom.

Calendar

MODULE 26

4 APPS

Events, invitations and who is actually free

Eleven lines of the specification that are genuinely one thing. Recurring events and time zones are where the real difficulty sits, and both are solved problems reached for from a library rather than reasoned about from first principles — an event repeating on the last working day of a month, moved once, in a zone that shifts its offset twice a year, is the kind of thing that must never be written by hand twice. Syncing to an outside calendar needs that provider's credentials and is a constraint; a calendar of this system's own is not.

100%

0%

- Events & Recurrence
- Invitations, Availability & Time Zones
- Shared & Team Calendars
- Resource Booking

Events & Recurrence

A dated entry with the people it concerns, and the rules for one that repeats. A single occurrence of a repeating event can be moved or cancelled without disturbing the rest of the series, which sounds small and is the difference between a calendar people trust and one they quietly stop using.

Shared & Team Calendars

A calendar belonging to a group rather than a person, with control over who may see a full entry and who may see only that the time is taken. The distinction matters: a team usually needs to know somebody is busy without being told what about.

Invitations, Availability & Time Zones

Asking somebody to an event, tracking whether they answered, and showing when they are genuinely free. Every time is stored as an absolute moment and displayed in the reader's own zone, so a meeting set across two countries means the same instant to both of them and survives a daylight-saving change landing between the booking and the day.

Resource Booking

The things that get double-booked as often as people do — a room, a vehicle, a machine, a piece of equipment. Held as a bookable record with the same conflict checking an invitation gets, because a room with two meetings in it is the same failure as a person with two.

Mail

MODULE 27

5 APPS

Sort, route and answer what arrives

The reading and organising half of email. Hosting a mail domain is a constraint rather than a task — deliverability and sending reputation are infrastructure a business rents and earns over months — but once a mailbox exists somewhere, filtering it, routing it and answering it from one place is ordinary work. It stands apart from the Helpdesk in CRM on purpose: a ticket is a thing with an owner and a resolution, while a mailbox is a stream, and pretending the stream is a queue is how genuine questions end up closed unanswered.

Shared Inbox

Folders, Labels & Search

Filters & Rules

Signatures & Auto-reply

Mail Admin Controls

Shared Inbox

One mailbox several people work, with it visible who is dealing with what so two of them do not answer the same message differently within a minute of each other. An address a business publishes belongs to the business, not to whoever happens to have the password for it.

Filters & Rules

What happens to a message automatically on arrival: filed, tagged, sent on to somebody else, or pulled to the top. Every rule that fired is visible on the message, because a mail that quietly vanished into a folder somebody forgot they created is indistinguishable from a mail that was never sent.

Mail Admin Controls

Who may open which mailbox, what is retained and for how long, and what may leave the organisation. This is the half that makes a shared mailbox safe to use for anything a business would mind losing.

Folders, Labels & Search

Filing, tagging and finding, including inside what is attached. Search is listed last in the specification and is the one people actually use all day, which is worth saying out loud when deciding what to build first.

Signatures & Auto-reply

The block appended to what goes out, and the answer sent while somebody is away. The away message names who to contact instead, so an absence routes the sender somewhere rather than simply telling them to wait.

Documents

MODULE 28

5 APPS

Write it, present it, and keep every version

A word processor, a presentation tool and notes. Eight lines of the specification that are in truth three substantial products, listed as though they were features — and this module says so rather than implying they are a fortnight of work. Honestly assessed it is the worst effort-to-value ratio anywhere in the design: every business already has these, and nobody adopts a business system for its word processor. It is written down as a named home so the specification is not silent about it, and it is ranked accordingly.

READS FROM

CRM

Projects & Collaboration

WRITES TO

CRM

Word Processor

Presentations

Notes

Co-editing & Track Changes

Version Recovery

Word Processor

Writing a document inside the system so it is filed against the record it concerns instead of living on somebody's laptop. The value is not the editor, which is a solved and crowded problem — it is that the document is attached to the order, the case or the person it is actually about.

Notes

Short-form writing that is not a document — a thought against a customer, a decision against a project. The format most used and least specified, which is usually a sign it should be built before the two above it.

Version Recovery

Getting back what a document said before somebody changed it. Listed once in the specification under storage and worth its own line here, because it is the feature nobody asks for until the first afternoon it is needed.

Presentations

Slides, for the same reason and with the same honest caveat: the point is where the file lives and what it is linked to, not that this is a better tool than the one already on every desk.

Co-editing & Track Changes

Two people in the same document without one of them overwriting the other, and a visible record of who changed what so an edit can be accepted or undone. This is the genuinely hard part of all three applications above, and the part a business actually notices missing.

Teach a process, and know who has been taught it

Course material, the lessons inside it, an assessment at the end, and a record of who has completed what. Eight lines that are one straightforward application over data HR & Payroll already holds about who works here. Genuinely useful on a factory floor, where a machine or a process has to be taught and the record of who was taught it is what a compliance audit asks for — which makes this the one module in this group with an obvious near-term case.

READS FROM HR & Payroll

Quality & Compliance

WRITES TO

HR & Payroll

Courses & Lessons Assessments Learning Paths & Progress

Courses & Lessons

The material somebody has to work through, in the order it makes sense, in the language the person being taught actually reads. Built over the staff records that already exist rather than a second list of people maintained beside them.

Learning Paths & Progress

A sequence of courses for a role, and who is where in it. The record that matters for compliance is this one: not that training was offered, but that a named person completed it on a date, and that the record can be produced when somebody asks for it.

Assessments

A check that something was understood, at the end of a course or as part of hiring. The same mechanism serves both, which is why the specification lists it twice and this design does not build it twice.

Connect to other systems without writing a connector each time

The connector framework, deliberately separate from any individual connector. The framework can be built and tested against recorded responses and needs nobody's credentials; the connectors themselves each need a live account and are constraints rather than tasks. It only becomes sensible after the Developer Platform exists, because a connector framework with nothing underneath it has nothing to offer the thing it connects to.

Runs inside the scope granted at install 100%

Connectors that widened their own reach 0%

Connector Library

A described connection to a named outside system, with how it proves who it is, how often it may be called and its quirks written down once instead of rediscovered by each person who integrates it. A connector nobody can run without credentials still has value as a specification of what connecting would take.

Integration Webhooks & APIs

The framework's own way in and out, distinct from the product surface in the Developer Platform: this is how a connector receives a push from the far side and how it calls back. Separated because the two have different audiences, and conflating them is how an internal mechanism accidentally becomes a public promise.

Identity & IT

MODULE 31

4 APPS

A second factor, and the internal-IT half of the specification

Four lines that are two quite different things, and the split is worth stating. A second proof at sign-in is small, standard, and should exist before anybody signs in over the internet at all — it is the one item here that matters for a real deployment. The other three are a product for IT departments, which a manufacturer is not. Naming them in one module rather than scattering them keeps that distinction visible, instead of letting a genuine near-term need sit in a queue behind three things nobody has asked for.

READS FROM

Platform

Every module

WRITES TO

Platform

Second Proof at Sign-in

Second Proof at Sign-in

A second proof at sign-in beyond a password, with recovery codes for the phone that gets lost and a policy for who must use it. The smallest item in this module and the only genuinely urgent one: a system reachable from the internet with a single factor is a system waiting for one reused password to matter.

IT Service Desk

Internal requests — a laptop, an account, access to something — as tickets with an owner and a resolution. The same shape as the customer Helpdesk in CRM, pointed inward, and honestly a different product from the one this system is for.

IT Service Desk

Internal requests — a laptop, an account, access to something — as tickets with an owner and a resolution. The same shape as the customer Helpdesk in CRM, pointed inward, and honestly a different product from the one this system is for.

Password & Secret Management

Password & Secret Management

Where shared credentials live so they stop living in a message thread, with who may retrieve which one recorded. This system never asks for a marketplace, bank or account password of its own; this app is about the credentials a business already has to hold for other things, and the fact that they are currently held badly.

Security Analytics

Sign-ins, failures and unusual patterns, read from the audit trail that already records everything. It needs no new capture because the record is already being kept — what is missing is anybody looking at it, which is what this app would be.

BUILT DEEP, NOT WIDE

The controls that pay for the software

Three-way match

A supplier bill only passes when the purchase order, the goods receipt and the invoice agree on price and quantity. Bills that over-charge or over-bill rejected goods are held automatically, with the reason in plain language.

Vendor risk that sees ahead

Risk blends weak performance, spend concentration and overdue bills. Your *best* supplier still flags medium risk when 44% of your buying sits with them — the fact worth knowing before a disruption, not after.

Settlement reconciliation

Import a marketplace settlement, match it to the orders, and see every commission, TCS deduction, weight discrepancy and short payment — with a claim pack ready to file.

Piece-rate and contractor pay

Pooled completion, per-unit rates, rework hours and advances roll into one payout for anyone paid by output rather than by the hour — and into a true cost per unit for every product.

One stock number

One quantity per SKU per location per stage, pushed to every channel. Overselling stops being a monthly apology.

AI studio built in

Listings, ad copy, product photography and reels generated against your own catalogue — not a bolted-on chatbot, but the same data core.

INDUSTRIES

One engine, any industry

Every app ships in two builds: a neutral unified-ERP configuration, and an industry configuration. The engine, formulas and tests are identical — only the master data differs.

Textile & apparel

Mills and trim suppliers, fabric in metres and pieces in numbers on one item master, piece-rate pay, design-wise costing, HSN 5007/5208, marketplace returns and wrong-return dead stock.

Medical & pharma

Distributors, batch and expiry tracking, QC pass rate as accept rate, cold-chain locations, and a regulated document trail nobody can quietly edit.

Manufacturing

Component suppliers, multi-level BOM, fill rate driving line stoppages, work orders, scrap and rework accounted where they happen.

Services

Subcontractors, milestone acceptance in place of goods receipt, timesheets, retainer billing and project profitability.

Drone & precision

Serial and lot tracking to the individual unit, calibration as a production stage you define, and certification paperwork filed against the batch it belongs to.

Law firms

A matter instead of an order: hearings, filings, opposing parties and e-signed engagement letters on one record. Time against the matter becomes the bill.

Chartered accountants

Clients, engagements and statutory deadlines in one calendar; staff hours costed per engagement; the practice's own books kept in the same system.

Trading & export

Multi-warehouse stock with one number, credit limits and ageing per buyer, commercial invoice, LUT bond and IGST refund — plus every channel in one queue.

Clinics & healthcare

An appointment is an order and a chair is a resource. Sessions, locums and retainers land in one payout register; licences and calibration are tracked with the evidence attached, not a tick in a box.

Restaurants & hospitality

A recipe is a bill of materials and a cover is a forecast. One stock number across kitchens, rotas that fill before the shift starts, and wage cost read against sales as it happens.

Education & training

A learner is a customer whose record runs from enquiry to alumnus. Cohorts are projects, fees are instalments, and admissions spend is judged on enrolments rather than on clicks.

Construction & sites

A site is a project with stages that get certified. Retention tracked to its release date, material ordered against a requirement, and cost booked to the site that incurred it.

Logistics & freight

A consignment is an order that moves. Bonded cargo is a location, demurrage is an ageing report, and what the carrier billed is checked against what was actually packed.

Field service

A job is a work order that travels. Van stock is a location like any other, parts fitted are booked to the job, and a callout is never invoiced without a signed sheet.

Food & agriculture

A batch is a production order with a yield. Intake traces back to the farms that supplied it, and nothing is released before its test comes back.

Agencies & studios

A retainer is a contract with rounds in it. Time books to the client that used it, deliverables carry the scope they belong to, and an extra round is a conversation before it is a cost.

COMPARISON

Medhava vs. a suite of integrated apps

The difference is architectural, not cosmetic.

CAPABILITY	MEDHAVA	TYPICAL SUITE
Architecture	One app, one data core	Many apps, integrated
Master data	Single Item & Party record	Duplicated per app, synced
Stock truth	One number per SKU × location	Per-app, reconciled nightly
Cross-module posting	Instant, via event bus	Scheduled sync jobs
Marketplace settlement	Reconciled to order line + claim pack	Usually a separate tool
Piece-rate manufacturing	Built in	Custom development
AI content & imaging	Native, on your catalogue	Third-party add-on
Offline capability	Single-file apps run offline	Cloud-only

TRUST & SECURITY

Your credentials are never the key

Scoped keys only

Marketplace, bank and courier connections use revocable, scoped API keys held in an AES-256-GCM vault. Medhava never asks for, uses or stores an account password.

Isolation by row

Every record carries a company id and is enforced by PostgreSQL row-level security. Group companies stay separate but consolidate on demand.

Immutable audit

Every posting, price change and permission grant is written to an append-only trail with actor, timestamp and before/after values.

Three categories of software. Nobody sells all three.

You are not short of tools. You are short of one tool that covers all of it —
which is why the numbers never agree.

Accounting & ERP suites

a desktop accounting package · a desktop accounting package · a desktop accounting package · a business-suite vendor · an open-source ERP

- ✓ Inventory sync, settlement
- ✗ No double-entry books, no GST return
- ✗ No manufacturing, purchase or payroll
- ✗ No content, image or video studio

AI content tools

Writing · image · video generators

- ✓ Copy, pictures, reels
- ✗ Knows nothing about your catalogue
- ✗ No orders, no stock, no books
- ✗ Nothing publishes to a channel
- ✗ Nothing reconciles afterwards

Medhava

All three, over one data core

- ✓ Books, GST, stock, purchase, manufacturing, payroll
- ✓ Marketplace and storefront order queue
- ✓ Settlement, claims, returns, packing footage
- ✓ Content, image, design and video studio
- ✓ One record underneath all of it

In an accounting package you will never get a marketplace OMS. In an OMS you will never get your books. In a content tool you will never get either. That is the gap. Medhava is built in it.

THE APPROACH

Built deep, not wide

A long feature list is easy. What is hard is the one control that stops the money leaking — so every module ships with one, and refuses rather than warns.

01

Accepted, not ordered

You order 100. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. Medhava raises stock by 96, claims credit on 96, raises a debit note for the 4, and lowers that supplier's accept rate. Automatically.

02

The payout, to the order line

Not "the channel paid ₹49.1 lakh". Which order line was short, by how much, against which published commission rate — with the claim pack already assembled and the packing footage attached.

03

Nothing derived is stored

Outstanding, ageing, promise dates, payouts, on-time percentage and risk are recomputed every time you read them. A stored number goes stale the moment the document under it changes. These cannot.

PRICING

Start free. Pay when it runs your business.

The software puts no ceiling on how many companies you run — your plan does, and you move up when you need to. Two of the 30 modules — E-commerce / OMS and the AI Content Engine — are priced on what you actually use, because an order is work and a piece of content is work.

Under 1,000

ANYTHING SPECIFIC YOU WANT TO SEE?

e.g. settlement reconciliation on Flipkart

Request a demo

We reply within one working day. Medhava will never ask you for a marketplace, bank or account password.

QUESTIONS

Frequently asked

What is Medhava?

Medhava is a unified ERP made of 30 modules and 165 apps that all read and write one shared data core — Item/SKU, Party, Stock, Ledger and Order. Because the data is shared, a single action such as a goods receipt updates stock, the ledger, quality records and the vendor scorecard at the same time.

How is Medhava different from a business-suite vendor or an open-source ERP?

Does Medhava support Indian GST?

Which marketplaces does Medhava connect to?

Can Medhava be used outside textiles?

Is my data safe?

Can I use it without internet?

Stop reconciling. Start running.

See your own numbers inside Medhava. Bring one month of sales, purchases and stock — we will show you what your current tools are hiding.

Run your whole business on one system

Medhava replaces the eleven tools you run today — accounting, stock, marketplace orders, manufacturing, staff and GST — with one application where every number agrees with every other one. Record a goods receipt once, and your stock, your books, your quality record and your supplier score all move in the same instant.

Start free for 30 days

✓ Free for 30 days ✓ No card details ✓ Works with the internet off

✓ GST, TDS & TCS ready

30

Modules, one login

165

Apps over one data core

1

Stock number for every SKU

7

Marketplaces connected

WHAT MEDHAVA IS

One application. Not eleven that talk to each other.

Every other suite sells you separate products and a sync job between them. Medhava is a single application over one set of records — so there is nothing to synchronise, and nothing to reconcile.

1

Enter it once

A goods receipt, a counter sale, a marketplace order — recorded in one place. Stock, the ledger, the quality record and the supplier scorecard all update in the same instant, because they are reading the same record.

2

Numbers that cannot disagree

One stock figure per SKU. One ledger. One order record. Not a copy per channel that somebody reconciles on Saturday. When the website says four are left, four are left.

3

Built for how India actually runs

GST with input credit on accepted goods, TDS and TCS, seven marketplaces, piece-rate and output-based wages — and apps that keep working when the internet does not.

WHAT CHANGES FOR YOU

The same day, before and after

Nothing here is a new way to run your business. It is the work you already do, arranged so that it only has to be done once.

TODAY

- ✗ Log into seven seller panels, one at a time
- ✗ Copy each order into a sheet, then into the books
- ✗ Guess which stock figure is the real one
- ✗ Learn at month-end that a supplier over-billed you
- ✗ Chase a marketplace shortfall you spotted six weeks late
- ✗ Ask three people for their file before you can see one number

WITH MEDHAVA

- ✓ One queue, sorted by whichever order is closest to being late
- ✓ The order writes itself into stock and into the ledger
- ✓ There is one stock figure, so there is nothing to choose between
- ✓ An over-billed invoice cannot be paid — the match refuses it
- ✓ Every shortfall is on a screen the day the payout lands
- ✓ Open the dashboard. It was already up to date.

Medhava at a glance

What it is	A unified ERP: 30 modules and 165 apps sharing one data core and one event bus.
Shared data core	Item/SKU · Party · Stock · Ledger & Voucher · Order — every module reads and writes these.
Key difference	Not a suite of integrated apps. One application, so there is no sync step and no duplicate master data.
Compliance	Double-entry accounting with CGST/SGST/IGST, TDS, TCS, ITC on accepted goods, GSTR-1 and GSTR-3B.
Channels	Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa, JioMart, plus the storefront platform and a self-hosted storefront platform.
Security	PostgreSQL row-level security per company; integrations use revocable scoped API keys in an AES-256-GCM vault — never account passwords.
Deployment	Hosted multi-tenant cloud, or single-file offline apps that run by double-clicking with no install.

THE PROBLEM

Your business runs on eleven tools that don't talk

Accounting in one place, stock in a spreadsheet, marketplace orders in seven seller panels, contractor wages in a notebook. Every month-end becomes an archaeology project.

Numbers that disagree

Stock says 40, the marketplace says 12, the books say something else again. Nobody knows which is right, so everyone guesses.

Work entered three times

The same invoice keyed into the seller panel, the spreadsheet and the accounting package. Three chances to be wrong.

Money quietly leaking

Over-billed purchases, unclaimed marketplace shortfalls, RTO losses — invisible until the year is over.

HOW IT WORKS

One data core. One action cascades everywhere.

Every module reads and writes the same five entities. That is the physical reason a single goods receipt can touch stock, books, quality and sourcing at the same instant.

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems increase stock by 100 and claim tax credit on 100. Medhava increases stock by 96, claims input tax credit on 96, raises a debit note for the 4 rejected, and lowers that supplier's accept rate — automatically.

Nothing derived is ever stored

Outstanding, risk, performance, ageing, profit per product — all recomputed on read. They cannot drift out of step with the documents underneath them.

Industry packs

A TRADE IS A ROW, NOT A FORK

10 SHIPPED

10 trades ship configured. The seventh is a file, not a release.

What a business calls things, the stages its work moves through, the extra fields its records need, the documents it issues and the data it starts with — all of it one configuration file. A pack may never contain code, invent a concept, extend a table that does not exist, hold money as anything but integer paise, or switch off the audit trail.

#	PACK	SECTOR	ITS WORDS FOR CUSTOMER · ORDER · WORKER	PIPELINES	DOCUMENTS
1	manufacturing	Manufacturing	buyer · sales order · operator	2	4
2	wholesale-distribution	Distribution	dealer · sales order · salesman	2	5
3	retail-ecommerce	Retail	shopper · order · associate	2	4
4	professional-services	Services	client · matter · fee-earner	1	4
5	healthcare-clinic	Healthcare	patient · appointment · clinician	2	4
6	logistics-3pl	Logistics	shipper · consignment · driver	2	5
7	hospitality-food	Hospitality	guest · ticket · crew member	2	5
8	education	Education	learner · enrolment · faculty member	2	6
9	construction	Construction	client · contract · site worker	2	6
10	field-service	Field service	customer · job · technician	2	5

The order is adoption, not taste: manufacturing is the largest ERP user base, professional services the second and the one with no stock at all, retail the largest warehouse-management segment, healthcare the fastest-growing, and transportation the most-served market among third-party logistics providers.

A walkthrough

The sections above say what Medhava is. This one follows a person through it, because "31 modules over one shared data core" is a true sentence that tells you nothing about your Tuesday.

Every screen below is a real render of the software, not an artist's impression — the same markup and the same stylesheet the product uses. The figures on them are illustrative.

Day one — from signing up to working, without a consultant

Nothing is blank when you arrive. Pick manufacturing and the system says sales order; pick professional services and the same screen says matter; pick the clinic pack and it says appointment. Same columns underneath, every time.

A day in the life — one order, followed all the way

An order arrives

MODULE 15 · E-COMMERCE / OMS

It lands in one queue with every other channel's orders, sorted by the time left on its cut-off rather than the time it arrived. The order that must leave in forty minutes is above the one that came in first and has all day.

Identity, Settings & Audit

Users, roles and permissions, company switching, tax and numbering setup — and an immutable record of everything that ever happened.

Industry Packs

What your trade calls things, the stages your work moves through, the extra fields your records need, the documents you issue and the reference data you start with — all of it loaded as a row of configuration, never as a separate version of the software. Pick the pack that matches your trade and the whole system changes its words: the same order screen reads as a job, a matter, a consignment or an appointment, with the same columns underneath. A pack may rename what exists, add fields to tables that exist, and switch discretionary rules off; it may never invent a concept, add a field to a table that does not exist, contain any executable code, or switch off the guarantees — company scoping, the audit trail, money never being a float — because a trade may change its vocabulary and may not opt out of the things the books are trusted for. Adding a trade nobody anticipated is therefore a file somebody writes, not a release somebody ships.

Ask & Print

Ask from your phone, anywhere: a ledger, a bill, today’s packing slips. It comes back as a PDF — or prints on the office printer, with nothing plugged into your phone.

Communications

WhatsApp commands and broadcasts, email and SMS, and the handful of scheduled jobs that carry a nudge to the right person without anyone remembering to send it. Every capability here has more than one interchangeable provider — none of them is ever the source of a figure the business reports.

WhatsApp Command Console

The shop floor does not open a laptop. A worker or a staff member sends a short message — in, out, today’s pieces, leave, an advance — and it becomes a real record: attendance with the time and place it was marked, a production report against the design, a request in the approvals queue. The end-of-day prompt asks what is still open and how long it needs, so tomorrow starts from what is actually pending rather than from memory. Marking attendance checks the phone is at the unit within the radius set for it, with a grace window; a person outside it is not refused, they are flagged for the manager, because a system that locks someone out of being paid for being early at the wrong gate has failed at its job. Every override is recorded with who made it. The words a worker types are in the language they speak, and nothing here ever asks for a password, a bank detail or a document number.

Data Privacy & Consent

What a person’s data may be used for, captured as consent at the point it is given and honoured everywhere downstream — including the right to have it corrected or removed. Retention (how long a record is kept) and deletion (a person’s right to have their own data removed) are two different policies, tracked separately, because a rule that keeps records for the law and a request from a person to be forgotten do not resolve the same way.

Provider Router & Cost Guard

The rule that no capability depends on one outside service, enforced at the moment it matters instead of merely promised. Every capability has an ordered fallback list ending on an option that needs nothing connected, so a courier API that stops answering at 9pm, or an AI key that hits its quota mid-catalogue, drops to the next option instead of stopping the work. A provider that keeps failing is tripped out of the list entirely and retried once after a cooldown rather than hammered; retries inside one provider wait twice as long each time. And every paid call is counted in paise against a ceiling you set — over the ceiling the paid provider is refused, not warned about, and the work completes on a free one. Because every capability is guaranteed a built-in or by-hand option, a spent budget can stop the spending without ever stopping the business.

Payment Data Scope

A written statement of exactly which systems ever see a card or bank credential, and which never do — because every card-capable screen in this system hands that moment to a payment provider’s own secured field and never stores or even passes the number through application code. The statement is what an auditor or a partner asks for before they will connect to this system.

Appearance & Localisation

The two settings a person notices in the first minute and nobody writes a specification for: which time zone a screen shows its dates in, and whether it is drawn light or dark. Time zone is the one that matters for correctness rather than comfort — every timestamp in this system is stored as an absolute moment, so a business working across two zones reads the same event at the right local time in both, and a working day that ends at midnight ends at midnight where the work happened.

Design & Sampling

MODULE 02

2 APPS

A style exists on paper before it exists as stock

A product moves from a first idea to something the business can actually make and sell — specification, sample rounds, costed trials and sign-off — before it is ever entered as a catalog record. Building this first means Inventory & Catalog never has to invent a style it has no real specification for.

PLM & Development

First idea to something you can actually make: specification, sample rounds, costed trials and sign-off, with every version kept. A product, a machined part, a formulation or a service package all move through stages you set yourself.

Design / IP Register

What protects a design once it exists — trademark or copyright status, the date it was first shown, and a flag the moment a near-identical listing turns up elsewhere. Every version already kept by PLM & Development gets a filed status here instead of just a date stamp, because a design with no ownership record on file is a design nobody can defend.

One number everyone trusts

The most important number in the system: one quantity per SKU, per location, per stage — read and written by every other module. And one product record that every channel lists from.

Stock

Live quantity by SKU, location and stage, with reorder alerts, batches, kits and dead-stock. Goods you still own but that sit in a channel's own warehouse are a location like any other, so consignment and sale-or-return stock is counted, valued and aged with everything else instead of disappearing off the books until it sells.

Catalog / PIM

One product record — attributes, images, HSN, MRP and the price each channel actually sells at — pushed to every marketplace and to your own storefront, and scored for each channel's rules before it lists. It also holds the two things everything downstream depends on: the code each channel knows this product by, mapped to yours, and the packed size and weight that decide the courier rate and settle every weight dispute. Every listing's state on every channel is here too — live, waiting for your approval, blocked, archived — with the quality score that decides whether anyone sees it.

Kit & Combo SKU

A sellable SKU made of component SKUs — a three-piece set sold as one listing. Selling the kit decrements each component at order time, so stock is right for every piece in the set, not just the set itself.

Master-Data Hygiene

Duplicate detection and merge across customers, vendors and designs, and a dead-stock register for what has not moved in months. Protects every downstream report from the same record existing twice under two names.

CRM

MODULE 04

5 APPS

Know every customer completely — and answer them fast

One record per customer carrying every lead, order, return, document and conversation, whichever channel it came from. Whoever picks up the next question can already see everything that came before it.

CRM & Customer 360

Documents & eSign

Helpdesk & Live Chat

Forms & Feedback (NPS)

Territories

CRM & Customer 360

Lead to won, then the full lifetime: orders, returns, value and what to offer next.

Documents & eSign

Every agreement, receipt, certificate and scan filed against the record it belongs to — an order, a party, a case, an employee — so it is found by that record instead of by remembering a folder. Send one out for signature and the signed copy files itself back.

Helpdesk & Live Chat

Questions arriving by chat, email or phone become tickets tied to the order or the account they are about, with the whole history already on the screen.

Forms & Feedback (NPS)

A short form after delivery, and the score it produces attached to the design or item it is actually about — not just the buyer — so a complaint-prone item surfaces as a pattern instead of a scatter of individual gripes.

Territories

Dividing customers and targets by region or by team, and reporting against that division. Worth having the moment there is a sales team large enough to divide and an argument about whose account something was; pointless before that. A territory is a row like anything else here, so redrawing the map is an edit rather than a migration, and last year’s figures stay readable against last year’s boundaries instead of being silently restated under the new ones.

Sales

MODULE 05

9 APPS

Every way you sell, one order book — to the doorstep

Retail counter, wholesale, export and your own website all write to the same order and draw on the same stock number. The courier side lives here too, so a sale is not finished when it is billed — it is finished when it is delivered and the COD money is in.

Customisation & Made-to-Measure

Appointment Booking

D2C Sales

Orders from your own storefront — hosted, self-hosted or custom — cart to dispatch, with loyalty and partial COD.

B2B & Credit

Wholesale orders with credit limits, tier pricing and outstanding ageing.

Export

Commercial invoice, packing list, LUT bond and IGST-refund tracking.

POS

Counter billing that draws on the same stock as your website.

Quotes & Proforma

Send a quote, convert it to a confirmed order in one click.

Couriers & AWB

Book the shipment on the order itself, compare couriers, print the label and follow the AWB to the door.

Subscriptions

A schedule that raises its own invoice on its cycle and follows up on its own when a payment fails — for anything sold as a standing order rather than a one-off.

Customisation & Made-to-Measure

The order that does not exist in the catalogue: a buyer sends reference pictures and their own measurements, a price is agreed over several messages, and the piece is made for them. All of it is one record — the references, the measurement set, every quote in the negotiation and what was finally agreed, the advance taken to start work and the balance taken before dispatch. When the order is accepted it opens a production order like any other, so a bespoke piece is costed, made, checked and posted exactly as a catalogue piece is. Two legs of money on one order is the part most systems get wrong: the advance is earned when the work starts, the balance is owed until the piece ships, and the ledger shows both separately rather than one payment appearing when the whole thing is over.

Appointment Booking

A slot a customer books for themselves — a fitting, a consultation, a service visit — against the real availability of whoever or whatever is needed for it. It writes to the same Calendar the rest of the business works from, so a booking taken on a website at midnight cannot collide with something already in the diary.

Turn what is selling into what to buy and make

Confirmed orders and demand history have to become a plan before Purchase can buy anything or Manufacturing can start anything — otherwise buying and making are both just guessing. This module sits between the two: it reads what is actually selling and what is already committed, and turns that into requirement, not the other way around.

- Demand Forecast & Signal
- Requirement Explosion (MRP run)
- Open-to-Buy / Budget Ceiling

Demand Forecast & Signal

What sold, by SKU and by period, turned into a short-term forecast — the number every requisition and every production order downstream is measured against instead of a guess.

Requirement Explosion (MRP run)

Confirmed demand exploded through the bill of materials into what raw material to buy and what to produce, and by when — so a purchase requisition or a production order always traces back to real demand, never to a feeling that stock is getting low.

Open-to-Buy / Budget Ceiling

A spending ceiling set per period regardless of what the demand signal suggests, so a real signal cannot on its own commit more money than the business has decided to risk this season. Every requisition the MRP run drafts is checked against what is left of the ceiling before it goes to Purchase.

Nothing over-billed gets paid

The buy side end to end — and the control that stops you paying for goods you rejected.

Vendor 360, payables, ageing, a real risk score, and sourcing that follows performance.

Know what a unit really costs to make

From material in the door to the finished unit — including what every worker earned and what each product actually cost. You define the stages, the rates and the rules; nothing here is fixed to one trade. Design and sample sign-off happen upstream now, and quality inspection and the compliance record live in their own module downstream — this module is purely the making.

Maintenance

🔑

Production Orders

Your own stages from first operation to finished goods, with work-in-progress visible at each one.

👥

Piece-rate & Contractors

Output-based pay for anyone paid by the piece rather than the hour — pooled completion, per-unit rates, rework and advances resolved into a single payout.

📦

BOM & Consumption

What each product consumes, costed at today's material rates.

🔑

Maintenance

Machines, tools and assets: what is due for service, when it was last done, what it cost, and what stopped while it was down. Planned and breakdown work against the same asset record.

Certify what was received and what was made

Quality inspection used to live buried as one step inside Manufacturing; it stands on its own here because a rejection at goods-receipt and a rejection on the production floor are the same discipline, and because the certificates a business holds — the proof it follows a standard — belong next to the inspections that back them up, not scattered across email.

Quality Control
- 📄

Certificate & Compliance Register

✓

Quality Control

Accept, reject or rework — on goods received and on goods made — with reasons that feed the supplier scorecard and the performance flags alike.

📄

Certificate & Compliance Register

Every standard the business or a vendor holds — a safety, labour or environmental certification — with its issue date, its expiry, and the audit that backs it, so a certificate about to lapse is visible before a buyer asks for it and finds it already expired. What this register tracks is what a sustainability report downstream is actually built from.

Pick right the first time — and prove what you sent

Bin-level instructions and barcode scanning, so the right item leaves the building and stock stays honest — and a recording of each parcel being packed, so an argument about what was in it is settled by footage instead of by memory.

- Rates & Zones
- NDR & RTO Rescue
- COD Remittance
- Handover & Manifest
- Fleet

Rates & Zones

Every courier's rate card by zone, weight slab and service — so the cheapest and the fastest option for this parcel are both known before it is booked.

COD Remittance

What the courier collected at the door against what reached your bank, parcel by parcel, with every shortfall named and aged.

Fleet

Your own delivery vehicles, if you run any — what each trip cost, what is due for service, and what that adds to freight. Optional; most businesses run couriers only.

NDR & RTO Rescue

A failed delivery worked while it can still be saved — reattempt, call, correct the address — before it becomes a return you pay for twice.

Handover & Manifest

What is expected out today against what the courier actually took, counted per courier and per service. The manifest to hand over, the one-time code to confirm it, and a signed record of the parcels that were left behind — so a parcel lost between your table and their van has an owner.

Books that always balance

A full double-entry ledger built for Indian compliance — not a tax report bolted onto a spreadsheet. Medhava keeps the books on its own: no other accounting package is required, ever.

Expenses

GST & Tax

ITC Reconciliation

Receivables, Payables & PDC

Fixed Assets & Depreciation

Year-End Close & Period Lock

Finance Reports

Accounting

Double-entry books where every voucher balances and the trial balance always ties.

Expenses

Spend captured by category with approvals, and bill OCR to save typing.

ITC Reconciliation

Every input credit matched against the government’s own GSTR-2A/2B before a return is filed, so a credit claimed is a credit that is actually on record.

Fixed Assets & Depreciation

The asset register with both Straight-Line and Written-Down-Value depreciation tracked side by side, and disposal posting its gain or loss straight to the books.

Finance Reports

P&L, balance sheet, and profit by channel, product and SKU.

Invoicing

GST tax invoices and receipts, totals computed from the lines to the paise. Where a channel raises its own invoice, both numbers live on the order — theirs and yours — so the panel’s paperwork and your books point at the same sale and neither has to be re-keyed to find the other.

GST & Tax

CGST, SGST, IGST, TDS, TCS, input credit, GSTR-1 and GSTR-3B — filed per registration, so a group where one company is registered and another is not files exactly what each one owes and nothing it does not.

Receivables, Payables & PDC

Payments and receipts allocated against named open invoices, and a register for post-dated cheques that posts only on the date they are realised, not the date they were written.

Year-End Close & Period Lock

Profit-and-loss accounts reset and balance-sheet accounts carry forward at year end, and a reviewed period locks against backdated edits until an admin unlocks it — an act that is itself logged.

Know what cash is coming, not just what already arrived

Accounting records what happened; this module is concerned with what happens next — how much cash is actually expected, when, and whether spend against a budget is on track before the month closes and turns the answer into history.

Cash Flow Forecast

Banking & Reconciliation

Budget vs Actual

- Cash Flow Forecast

Expected receipts and expected payments laid out by week, drawn from open invoices and open bills rather than typed in by hand — so a cash shortfall is visible weeks before the date it would actually bite.
- Budget vs Actual

A budget set per category and period, and actual spend from Accounting tracked against it as the period runs — not only after it closes, when the only thing left to do is explain the variance.

Banking & Reconciliation

Bank statement lines matched against the ledger’s own record of what should have moved, with anything unmatched surfaced instead of silently carried forward.

Get paid what you are owed — cycle by cycle

Matching one payout to one order line happens in OMS. This module is the level above it: the settlement cycles each panel runs, the fees it actually charged against the fees it published, and the tax it deducted on your behalf.

 Payout Cycles

 Fee & Commission Audit

 TCS & TDS Register

Payout Cycles

Every settlement cycle each panel runs — what it should pay, what actually landed in the bank, and on which day — so a late payout is visible the day it is late, not at month end.

TCS & TDS Register

Every rupee the panels deducted as TCS and TDS, matched against the portal's own figures — so the credit you claim is the credit you are actually owed.

Fee & Commission Audit

The rate card a channel publishes against the rate it actually charged, category by category and SKU by SKU. A silent commission increase is caught the first time it is applied — and the tier you are rated in is on the same screen, because the tier is what the rate card hangs off, and losing one quietly costs more than any single deduction.

 E-commerce / OMS

MODULE 15

11 APPS

Every marketplace and your own website, one queue

Stop logging into seven seller panels and your own store admin. Every order — Amazon, Flipkart, Meesho, Ajio, Nykaa, JioMart, Myntra, and your own storefront, a self-hosted storefront platform or custom site — lands in one pipeline, and one stock number goes back out to all of them. Then the money side closes in the same module: what each channel paid, what it kept, what came back, and what you are still owed.

 Claims & Disputes

 Returns / RMA

 Channels & Storefronts

 Labels & Documents

 Listing & Catalog Manager

 Size / Fit Recommendation AI

 AR / Virtual Try-On

Marketplace OMS

Every marketplace and every storefront in one order queue — Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa and JioMart alongside any hosted, self-hosted or custom storefront. The stages each channel really uses — to accept, to pack, ready to dispatch, handed over, in transit — with the right cut-off counting down on every order, because a quick-commerce or air-shipped order is not due at the same hour as a standard one. Priority orders first, the day grouped by product so one item is picked once instead of once per parcel.

Manual Data Check

Upload the sheets you already download — marketplace orders and returns, and your own counter-shop registers, one file or a whole ZIP — and read ten cross-checks back: money, month, item, state, returns, claims, ads, payouts and GST. Every figure is clickable down to the transactions behind it, and the whole result downloads as Excel.

Claims & Disputes

Turn shortfalls, weight disputes and lost parcels into filed claims with evidence — and answer them before the clock runs out. A claim that is awaiting your response is worth money; one closed for no response is worth nothing, so the days remaining sit on the screen next to the amount.

Channels & Storefronts

Connect a channel once and it stays in step: catalogue out, price out, stock out, orders in. Seven marketplaces and any website platform — any hosted, self-hosted or custom site over its own API — each switchable without touching your data. Shopsy and any other storefront a channel runs alongside its main one counts as its own channel here. Where a channel has no open interface, its own downloaded report is a first-class way in. A channel may also know you by a different trading name — that is a label on the channel, not a second company, so it tags the order and the payout without ever splitting your books.

Listing & Catalog Manager

Bulk-create and bulk-edit listings across every channel from the one product record in Inventory & Catalog, and catch the mismatches that quietly cost sales: listed but out of stock, or in stock but never listed.

AR / Virtual Try-On

A way to see drape, fit and colour on a screen before buying, for items where a flat photo alone leaves too much to guess.

Order Management

One pipeline from new to delivered, whether the order came from a seller panel, your own storefront site, a dealer or the counter.

Reconciliation

Match every marketplace payout to the order line that earned it, and expose the gap.

Returns / RMA

Customer, courier and wrong returns — and the dead stock they actually cost you.

Labels & Documents

The channel gives you a PDF; this turns it into something a packer can work from. Cropped to your label size, your own product code printed large where the channel left it off, the invoice and the packing slip merged behind it, and the whole batch sent to the label printer in one job. Reprint a single parcel without redoing the batch — and nothing is ever uploaded to an outside website to be cropped.

Size / Fit Recommendation AI

A fit suggestion at the point of purchase, built from the item's own measurements and the return history of buyers who picked each size — aimed straight at the return reason that costs the most: the right item in the wrong size.

Pay people right, on time

Salaries and output-based earnings in one register, with attendance driving both — whether people are on a monthly wage, an hourly rate or paid by what they finish.

Staff & Contractors

Time-off & Advances

Appraisal & Hiring

Recruitment

Payout Execution

Employee Engagement & Surveys

Staff & Contractors

Attendance, effective-dated salary and output-based earnings in a single register, whoever is on it.

Appraisal & Hiring

Performance reviews and a hiring pipeline that ends in an employee record.

Payout Execution

Where the calculation in the earnings register actually turns into money leaving the business — bank batch, UPI, cash against a signed receipt — with the method and the reference recorded against every payout, so the register's total and the money that actually moved can always be checked against each other.

Time-off & Advances

Leave, festival advances, and exactly how they change this month's payout.

Recruitment

The pipeline before someone becomes an employee — an opening, the people who applied for it, a trial piece where the work itself is the interview, and the decision with its reason kept. It matters more in a skilled trade than in most: a person is taken on for skill at one particular kind of work, and the trial output is the evidence, so it is recorded against that work and the rate that would apply rather than remembered as an impression. A candidate who is not taken on now stays findable when the same skill is needed in a busy month, and their personal documents are held under the same consent and retention rules as anyone else's, not in a folder on somebody's phone.

Employee Engagement & Surveys

Asking the people who work here how it is going, and keeping the answers where a pattern can be seen rather than in one manager's memory. Anonymity has to be real to be worth anything: a survey that quietly identifies its respondents produces polite answers and no information, so where a response is promised anonymous it is stored unlinked from the person, and the system cannot re-join them afterwards even for an administrator.

Automation

Blog & Pages

Events

Website & Page Builder

Markdown / Clearance Optimization

Social Engagement & Inbox

Social Calendar

Plan and publish across every channel from one calendar.

Campaigns

Email, SMS and WhatsApp campaigns measured on real revenue, not opens.

Repricing Engine

Rules per channel and SKU — floor, ceiling, match-lowest, festival overrides — and what each change actually did. A price that went up and took the orders down with it shows as exactly that, next to the rule that raised it, so the rule can be reversed on evidence rather than on a feeling.

Automation

If this happens, do that — across any module, without writing code.

Blog & Pages

Articles, landing pages and category copy written, scheduled and published straight to your own site — any hosted, self-hosted or custom storefront — with the meta title, description and internal links set before it goes out.

Events

Trade shows and exhibitions worked as a channel of their own — booth, budget and every lead captured on the floor landing straight in CRM instead of on a stack of business cards.

Website & Page Builder

The storefront itself, built by dragging sections into place rather than by editing a theme file — hero, product grid, size guide, lookbook, contact form — each block reading live from the catalogue, so a price or a stock state on a landing page is the same number the order screen uses instead of a figure someone pasted in and forgot. Blog & Pages above writes articles into a site that already exists; this is for the businesses that do not have one, and it is the gap that shows up plainly when this module list is set beside a mature open-source ERP: they ship a full site builder next to the blog, and until now this did not.

Markdown / Clearance Optimization

The same rule engine that reprices for competitiveness, aimed at ageing stock instead: when to start discounting it and by how much, before it becomes a warehouse write-off rather than a sale at a lower margin.

Social Engagement & Inbox

The replies, comments and messages that arrive on the accounts the business posts from, in one queue rather than four apps on somebody's phone. Distinct from the Social Calendar, which decides what goes out: this is what comes back, and it is where a complaint first appears in public. A message here can become a Helpdesk ticket with the thread already attached, so a public question and a private one end up in the same place.

AI Content Engine

MODULE 18

Video Studio

Design Studio

Motion Renderer

Narration Studio

Image Generation Slot

Publisher

Content Engine

Fourteen stages in your own voice, from buyer research and competitor reading through hooks, channel-ready listings, ads, social posts, video scripts, song lyrics, the publishing calendar and alt text — each written from your own catalogue, so the words match the thing.

Video Studio

Text and image to video, reels and ad cuts sized for every channel.

Image Studio

Layers, free transform, background removal, channel presets and SEO alt text — a phone photo becomes a channel-compliant product image.

Design Studio

A full design surface — templates, layers, undo and redo, any colour, exact sizing, background images and stock elements — exporting PNG, JPG or PDF at whatever size the channel or the printer asks for.

Motion Renderer

A reel rendered from a page of HTML and CSS — the same layers, fonts and brand colours the Design Studio already uses — into a real MP4, on this machine, with nothing uploaded. It is not a screen recording: the clock is faked, the animation is seeked to the exact instant of each frame, and only then is that frame captured, so the render does not care whether the machine was busy. Rendering the same festival banner twice produces the same file to the byte, which is what makes a reel something you can check and re-cut rather than something you have to watch all the way through and hope about.

Image Generation Slot

Generated imagery — a model on a background you do not have to shoot, a festival backdrop, a lifestyle scene — as a capability with interchangeable providers rather than a bet on one service: a queue of jobs, a preview while it works, inpainting to fix one region, upscaling and face correction. This one needs a graphics card. Image models cannot run on an ordinary office machine or on the container this system is built in, so what ships is the queue, the review screen and the provider slot, with the generating itself done by whichever engine you point it at — your own GPU box, or a cloud service, swapped without touching anything else. Said plainly here because the alternative is a screen that looks finished and produces nothing.

Narration Studio

A voice over the reel, in the language the buyer actually speaks — the same script the Content Engine wrote, spoken. The default needs nothing installed and no key, because every modern browser can already speak; a self-hosted or cloud voice sits behind it as an interchangeable provider for anyone who wants a cloned or branded one. Long scripts are split at sentence boundaries and rejoined, so a two-minute description is not cut off at whatever limit a service imposes. A voice cloned from a real person is only ever used with that person’s recorded consent, filed against them in Data Privacy & Consent like any other permission.

Publisher

One push sends the finished listing, picture and copy everywhere it has to appear — your storefront, each marketplace, each social account — and reports back what actually went live and what was rejected, with the reason.

Be found by a search box, an answer box and an AI

Content already exists once this module is reached; here it is made findable — by a traditional search engine, by the answer box above the results, and by the AI assistants now answering shopping questions directly instead of sending someone to a results page.

Technical SEO & Schema

Structured data, sitemaps and page-level technical checks against your own storefront and content pages, so a search engine can read what a page is actually about instead of guessing from the text alone.

Answer-Engine Optimization

Content shaped to be quoted directly by an answer box or a voice assistant — a clear, citable answer near the top of the page — rather than written only for a person to scroll through.

AI-Engine Visibility Tracking

Whether and how this business is actually cited when someone asks an AI assistant a shopping question in this category, tracked over time — the same discipline as rank tracking, aimed at a newer kind of result page.

Projects & Collaboration

MODULE 20

7 APPS

The work that is not an order — and the talking around it

Not every business runs on orders. A law firm runs on cases, an agency on engagements, a workshop on jobs, a builder on sites. This module holds that work on the same records as everything else, so the time, the cost, the documents and the decisions attached to it end up in the books rather than in somebody's inbox.

Automation Studio

Discuss

Knowledge Base

Projects & Cases

A project, a case file, an engagement or a job — whatever your work is called. Stages you define, owners, deadlines, documents, billable time and real cost, all on one record the ledger can see.

Approvals

One queue for everything waiting on a yes — a purchase order, a discount, a leave day, a credit note, a payment. The rule that sent it there is on the screen next to it, and the decision goes to the audit record.

Automation Studio

The place a person builds “when this happens, do that” by dragging it out and watching it run — a trigger, the steps after it, a branch where the answer decides which way to go — over the same event stream every module already writes to. Marketing’s Automation aims that idea at campaigns; this is the general one, reaching any module: a payment marked short holds the next dispatch and opens a claim, a worker’s pooled output crossing a threshold raises the payout for approval, a return marked damaged writes off the piece and messages the buyer. Every run is kept — what fired it, each step, what each step returned — because an automation nobody can inspect afterwards is a rule the business cannot trust with its money.

Knowledge Base

A searchable internal wiki of standard operating procedures, scoped to the role it applies to, so how a task is meant to be done is written down once instead of carried in one person’s head.

Timesheets & Planning

Who is on what this week, and the hours that actually went in — against a project, a case, a job or a machine. Billable and non-billable separated, so a rate card turns straight into an invoice and a real cost.

Forum

Questions and answers that outlive a chat — for customers, dealers or staff — with the useful ones kept where the next person will actually find them.

Discuss

Conversation attached to the record it is about: this order, this bill, this case. A year later the reason for a decision is still sitting next to the decision.

Dashboard & BI

MODULE 21

9 APPS

See the whole business without asking anyone

Every number in Medhava rolls up here as work happens — no exports, no waiting for month-end, no asking three people for their sheet. It is the last module built for a reason: it has nothing to show until the other twenty are producing real records for it to read.

READS FROM

Group dashboard · All companies · FY 2026-27

CEO Dashboard

Report Builder

Group Consolidation

Excel Dashboard Builder

ESG / Sustainability Reporting

Data Warehouse

Pipelines & Enrichment

Maps & Geospatial Views

Embedded Analytics

CEO Dashboard

Cash, sales, stock, profit and alerts on one screen, refreshed as work happens.

Group Consolidation

Several companies, one set of figures — sales, cash, stock and profit rolled up across every company you run, inter-company entries removed, with years of history to compare against. Add a company whenever the business grows one; nothing in the software caps the number, only the plan does. And a company with no tax registration of its own — a job-work arm, a new venture not yet registered — is a company like any other here, kept in the group figures without being dragged into a return it does not belong in.

Report Builder

Drag the fields you want into a report and save it for the whole team.

Excel Dashboard Builder

A full workbook — financial summary, HR, purchase, sales, inventory and production, GST, expenses — generated from the live records behind every other screen, with each company shown as its own row and a consolidated row that is a formula over them, never a separately typed total.

ESG / Sustainability Reporting

Water usage, chemical compliance, waste and packaging, reported from the same certificate and audit records Quality & Compliance already keeps — so a sustainability report is a query over evidence already on file, not a separate exercise assembled once a year from scratch.

Pipelines & Enrichment

The scheduled movement of data into that shape, and the step that fills in what a record was missing from somewhere else. Enrichment is the part that needs care: a field filled in from an outside source has to stay visibly different from one the business entered itself, or a guess quietly becomes a fact in next quarter's report.

Embedded Analytics

A report placed inside another screen, or inside somebody else's system, rather than opened from the reports list. It reads through the same permissions as everything else, so an embedded view can never show a viewer more than they could have seen by opening the report directly — which is the mistake that makes embedding dangerous when it is bolted on afterwards.

Data Warehouse

Somewhere shaped for asking questions rather than for recording transactions. Honestly premature: a warehouse is what a business builds when queries against the live records start hurting, and nothing here has ever run at a volume that could hurt. It is named so the specification has a home for it, and ranked as what it is.

Maps & Geospatial Views

Figures drawn on a map instead of in a column, for the questions that are actually about geography — where the orders come from, where the returns concentrate, which routes cost what. One visualisation type among many, listed separately in the specification and kept separate here because it needs location on the records before it can show anything at all.

 AI Assistant, Agents & Automation

MODULE 22

7 APPS

Ask the business a question — and let the routine work run itself

Last for the same reason Dashboard & BI is late: something that answers questions about the whole business can only be built once the whole business is in one place. Three different things live here and the difference between them matters. An ASSISTANT answers a question you asked, from the records, with the records attached. A CHATBOT holds the same conversation with your customer instead of you. An AGENT is given a job rather than a question and works out the steps itself. That last one is what separates this module from Automation Studio in Module 20, where a person draws the steps in advance and the rule runs the same way every time; and from Automation in Module 17, which fires marketing campaigns and nothing else. Both of those stay exactly as they are — this module sits above them and calls them, rather than replacing either. Module 18 writes content; this module answers and acts.

-  Corrections & What It Has Learned

AI Assistant

Ask in your own words — “what did Myntra actually pay us last week, and what is still short?” — and get the answer with the rows it came from sitting underneath it, each one clicking through to the record. It reads the ledger, the stock table and the settlement lines the same way a report does, so the figure it gives is the figure the books give. When it cannot find the answer it says so and shows what it looked at; it never estimates a number and presents it as a fact, because a plausible wrong figure is far more expensive than an honest blank. It answers only from records the person asking is already allowed to open, so it can never become a way around permissions.

AI Agents

A job rather than a question: “chase every unreconciled settlement line from last week and draft the claim for each.” The agent works out the steps, does them, and stops at the point where a person has to decide. It runs inside a scope you set — which records it may read, which it may write, and how much it may spend through the Module 01 Provider Router — and it cannot quietly widen that scope mid-run. Anything that moves money, files a claim, changes a price or sends a customer a message waits for a human yes.

AI Chatbot

The same engine turned to face the customer, on your own storefront and on WhatsApp: where is my order, will this size fit me, I want to return this. It reads the real order and the real size chart rather than a script written six months ago, and it will say “let me get someone” instead of guessing at anything about money, a refund or a complaint. The handover goes into the Module 04 Helpdesk queue with the whole conversation already attached, so the person picking it up starts where the customer left off instead of asking them to explain again. It never asks a customer for a card number, a bank detail or a password — that promise does not get a chatbot-shaped exception.

Agent Guardrails & Run Log

What each agent is allowed to touch, written down as a scope rather than trusted to a prompt, and every run recorded step by step: what started it, what it read, what it proposed, what a person approved, what it actually changed. Kept in the same audit trail as everything else, with the same absence of an off switch. An agent whose working nobody can inspect afterwards is not a colleague, it is an unexplained entry in the books.

Knowledge & Retrieval

The index that makes the answers grounded: your own designs, rate cards, settlement files, standard procedures and past decisions, searchable so a reply quotes what is actually on file instead of what a model remembers about the trade in general. Permission-scoped at the row, so two people asking the same question get answers drawn only from what each of them may already see.

Voice In and Out

The same assistant asked out loud and answering out loud, because the people who most need a figure are often holding something in both hands. A question spoken in the language the speaker actually uses becomes the same query the typed assistant would have run, and the answer comes back as speech with the rows still attached for anyone who wants to look at them. It refuses exactly what the typed one refuses: it will not read out a figure it could not find, and it will not take a password, a card number or a bank detail by voice — a spoken channel does not get an exception to a promise the rest of the system keeps.

Corrections & What It Has Learned

When the assistant gets something wrong, the correction is a record rather than a conversation that scrolls away. Somebody says what the right answer was, that sits against the question it belongs to, and the next person asking gets the corrected version with a note of who corrected it and when. The whole list is readable and editable by the business — not a hidden memory quietly steering answers — so a correction made in haste can be found and undone. Nothing here changes the model; it changes what the model is shown, which is the only kind of learning anybody can audit afterwards.

Developer Platform

MODULE 23

9 APPS

Let other software talk to this one — and build on it

One decision, not twenty-five: whether anything outside this system may call it. Twenty-five lines of the specification are that single capability written out from four different places, which is why it stands as a module instead of a feature buried in Platform. A versioned surface with keys and rate limits, webhooks going out, functions running on top, and only then a builder that lets somebody assemble a screen without writing code. The order matters, because a builder over nothing is a demonstration. The sign-on model has to be settled before any of it: changing how a caller proves who it is afterwards means reissuing every credential ever handed out.

Developer Console

App Marketplace

Robotic Process Automation

API & Access Keys

A versioned surface over the records this system already keeps, with a key per caller, a rate limit per key, and a log of what each one asked for. Versioned from the first release rather than the third, because the moment an outside system depends on a response shape, changing it silently breaks somebody else's software at a time nobody chose. A key is scoped to exactly the records its holder may already read, so this can never become a way around the permissions every screen obeys.

Functions & Scripting

Small pieces of logic that run inside the system — when a record changes, on a schedule, or when an automation calls them. Each runs with a time limit, a memory limit and the permissions of whoever or whatever triggered it, so a script can never read what its author could not. What a function did lands in the same audit trail as everything else.

Builder Data Model

The tables and relationships a built application stands on: what a record is, which other records it points at, and which fields may not be empty. Kept separate from the builder because the data model is the expensive half to change later — a screen can be redrawn in an afternoon, a relationship that was wrong has to be migrated with all the rows already sitting in it.

Calls inside the caller's granted scope

100%

Versions retired without an announced date

0%

Webhooks

The other direction: this system calling out when something happens rather than waiting to be asked. A subscription names the event and the address to post to, deliveries are signed so the receiver can tell a real call from a forged one, and a failed delivery is retried on a widening interval and then parked where somebody can see it instead of being dropped. Every attempt is recorded, because an integration that silently stopped firing is worse than one that never worked at all.

Low-code App Builder

Assemble a screen and the record behind it by dragging fields rather than writing code, for the cases a trade needs and nobody anticipated. What it produces is a configuration row, exactly as an industry pack is, and never a separate copy of the software — so an assembled screen still obeys company scoping, the audit trail and every guarantee the rest of the system makes.

App Versioning & Release

A built application has versions, somewhere to try one before it goes live, and a way back. Without this the person who assembled a screen is editing the live system at the exact moment they are still learning it, which is how a business loses a day of entries.

Developer Console

One place to see what the platform is doing for a given caller: keys issued, calls made, webhooks delivered or failed, functions run, and what each one cost. Somebody debugging an integration at two in the morning should not have to ask a person for a log.

Robotic Process Automation

Driving another system that offers no interface of its own by working its screens the way a person would. It is the least reliable way to connect anything, and worth having only when the alternative is somebody retyping figures every morning — so it is recorded here as a last resort with a run log proving what it actually did, never presented as equivalent to a real connection.

App Marketplace

A directory of applications built on this platform that a business can install into its own company, with what each one may read and write shown before installation rather than discovered after it. Nothing installs without somebody first seeing the scope it is asking for.

Plan work in iterations, and see what actually got done

Thirteen lines of the specification that amount to one board, one boundary and one chart. It sits beside Projects & Collaboration rather than inside it because a task list and a sprint are different disciplines: a task is either done or not, while a sprint asks how much a team reliably finishes in a fixed period and holds that answer against the last one. A business running a factory may never want any of this, which is precisely why it is a module that can be left switched off instead of something bolted onto the task list everybody uses.

100%

Product Backlog & Stories

The queue of work that has not been started, written as something a person wants rather than a task somebody was handed, grouped under the larger outcome it belongs to and sized relative to the others. Sizing is deliberately relative and not in hours, because the one thing teams estimate consistently is whether a piece is bigger than another piece.

Sprints & Boards

A fixed period with a set of work committed to it, and a board showing where each piece has got to. The boundary is the point: work added midway is visible as having been added midway, so the difference between what was planned and what was delivered stays legible instead of being quietly absorbed. Planning at the start and a review at the end are part of the same record, not meetings held somewhere else.

Velocity & Burndown

How much this team actually finishes per period, and how the current one is tracking against what remains. Both are read from the board rather than typed by anybody, which matters because a progress figure a person types is a figure a person can round.

Release Planning

Which finished work goes out together and when, drawn from what the sprints have actually completed rather than from what was hoped for at the start. A release date derived from delivered work is the only kind that survives contact with the second sprint.

Who is invited, who came, and what was decided

The half of meetings that is not live video: who is invited, when it is, who attended, what was decided, and a poll or a question queue while it runs. The video itself needs media servers, bandwidth and relays, which a business rents rather than builds, so it is recorded as a constraint instead of a module. Separating the two is the whole idea — the useful and durable half does not need the expensive half, and a decision nobody wrote down is lost whether or not the call was recorded.

Meeting Scheduling

Participants, Co-hosts & Moderators

Polls & Q&A

Call & Meeting Analytics

Meeting Scheduling

Proposing a time, holding the slot, and letting people say whether it works before it is fixed. It reads the same availability the Calendar module keeps, so a meeting cannot be booked into a time the system already knows is taken.

Polls & Q&A

A question put to everyone with the answers counted, and a queue of questions from the floor that can be ordered by how many people want the same one asked. Both outlive the call: the result is attached to the meeting record rather than disappearing when the window closes.

Participants, Co-hosts & Moderators

Who is invited, who may run the session, and who may quiet it down. Three separate roles rather than one, because the person who owns the meeting is often not the person who should be managing a room of forty people while also presenting to them.

Call & Meeting Analytics

The record of contact — that a call or a meeting happened, with whom, about which account, and what came out of it — filed against the customer or the project it concerned. This is the half with lasting value: six months later nobody needs the recording, they need to know what was agreed and by whom.

Calendar

MODULE 26

4 APPS

Events, invitations and who is actually free

Eleven lines of the specification that are genuinely one thing. Recurring events and time zones are where the real difficulty sits, and both are solved problems reached for from a library rather than reasoned about from first principles — an event repeating on the last working day of a month, moved once, in a zone that shifts its offset twice a year, is the kind of thing that must never be written by hand twice. Syncing to an outside calendar needs that provider's credentials and is a constraint; a calendar of this system's own is not.

Shared & Team Calendars

Resource Booking

Events & Recurrence

A dated entry with the people it concerns, and the rules for one that repeats. A single occurrence of a repeating event can be moved or cancelled without disturbing the rest of the series, which sounds small and is the difference between a calendar people trust and one they quietly stop using.

Shared & Team Calendars

A calendar belonging to a group rather than a person, with control over who may see a full entry and who may see only that the time is taken. The distinction matters: a team usually needs to know somebody is busy without being told what about.

Invitations, Availability & Time Zones

Asking somebody to an event, tracking whether they answered, and showing when they are genuinely free. Every time is stored as an absolute moment and displayed in the reader's own zone, so a meeting set across two countries means the same instant to both of them and survives a daylight-saving change landing between the booking and the day.

Resource Booking

The things that get double-booked as often as people do — a room, a vehicle, a machine, a piece of equipment. Held as a bookable record with the same conflict checking an invitation gets, because a room with two meetings in it is the same failure as a person with two.

Mail

MODULE 27

5 APPS

Sort, route and answer what arrives

The reading and organising half of email. Hosting a mail domain is a constraint rather than a task — deliverability and sending reputation are infrastructure a business rents and earns over months — but once a mailbox exists somewhere, filtering it, routing it and answering it from one place is ordinary work. It stands apart from the Helpdesk in CRM on purpose: a ticket is a thing with an owner and a resolution, while a mailbox is a stream, and pretending the stream is a queue is how genuine questions end up closed unanswered.

Mail Admin Controls

Shared Inbox

One mailbox several people work, with it visible who is dealing with what so two of them do not answer the same message differently within a minute of each other. An address a business publishes belongs to the business, not to whoever happens to have the password for it.

Folders, Labels & Search

Filing, tagging and finding, including inside what is attached. Search is listed last in the specification and is the one people actually use all day, which is worth saying out loud when deciding what to build first.

Filters & Rules

What happens to a message automatically on arrival: filed, tagged, sent on to somebody else, or pulled to the top. Every rule that fired is visible on the message, because a mail that quietly vanished into a folder somebody forgot they created is indistinguishable from a mail that was never sent.

Signatures & Auto-reply

The block appended to what goes out, and the answer sent while somebody is away. The away message names who to contact instead, so an absence routes the sender somewhere rather than simply telling them to wait.

Mail Admin Controls

Who may open which mailbox, what is retained and for how long, and what may leave the organisation. This is the half that makes a shared mailbox safe to use for anything a business would mind losing.

Write it, present it, and keep every version

A word processor, a presentation tool and notes. Eight lines of the specification that are in truth three substantial products, listed as though they were features — and this module says so rather than implying they are a fortnight of work. Honestly assessed it is the worst effort-to-value ratio anywhere in the design: every business already has these, and nobody adopts a business system for its word processor. It is written down as a named home so the specification is not silent about it, and it is ranked accordingly.

100%

Documents whose only address is a folder

0%

Word Processor

Writing a document inside the system so it is filed against the record it concerns instead of living on somebody's laptop. The value is not the editor, which is a solved and crowded problem — it is that the document is attached to the order, the case or the person it is actually about.

Presentations

Slides, for the same reason and with the same honest caveat: the point is where the file lives and what it is linked to, not that this is a better tool than the one already on every desk.

Notes

Short-form writing that is not a document — a thought against a customer, a decision against a project. The format most used and least specified, which is usually a sign it should be built before the two above it.

Co-editing & Track Changes

Two people in the same document without one of them overwriting the other, and a visible record of who changed what so an edit can be accepted or undone. This is the genuinely hard part of all three applications above, and the part a business actually notices missing.

Version Recovery

Getting back what a document said before somebody changed it. Listed once in the specification under storage and worth its own line here, because it is the feature nobody asks for until the first afternoon it is needed.

Teach a process, and know who has been taught it

Course material, the lessons inside it, an assessment at the end, and a record of who has completed what. Eight lines that are one straightforward application over data HR & Payroll already holds about who works here. Genuinely useful on a factory floor, where a machine or a process has to be taught and the record of who was taught it is what a compliance audit asks for — which makes this the one module in this group with an obvious near-term case.

Assessments

A check that something was understood, at the end of a course or as part of hiring. The same mechanism serves both, which is why the specification lists it twice and this design does not build it twice.

Connect to other systems without writing a connector each time

The connector framework, deliberately separate from any individual connector. The framework can be built and tested against recorded responses and needs nobody’s credentials; the connectors themselves each need a live account and are constraints rather than tasks. It only becomes sensible after the Developer Platform exists, because a connector framework with nothing underneath it has nothing to offer the thing it connects to.

Connectors that widened their own reach

0%

- 
Connector Library

A described connection to a named outside system, with how it proves who it is, how often it may be called and its quirks written down once instead of rediscovered by each person who integrates it. A connector nobody can run without credentials still has value as a specification of what connecting would take.

Integration Webhooks & APIs

The framework's own way in and out, distinct from the product surface in the Developer Platform: this is how a connector receives a push from the far side and how it calls back. Separated because the two have different audiences, and conflating them is how an internal mechanism accidentally becomes a public promise.

Identity & IT

MODULE 31

4 APPS

A second factor, and the internal-IT half of the specification

Four lines that are two quite different things, and the split is worth stating. A second proof at sign-in is small, standard, and should exist before anybody signs in over the internet at all — it is the one item here that matters for a real deployment. The other three are a product for IT departments, which a manufacturer is not. Naming them in one module rather than scattering them keeps that distinction visible, instead of letting a genuine near-term need sit in a queue behind three things nobody has asked for.

READS FROM

Platform

Every module

WRITES TO

Platform

Second Proof at Sign-in

Second Proof at Sign-in

A second proof at sign-in beyond a password, with recovery codes for the phone that gets lost and a policy for who must use it. The smallest item in this module and the only genuinely urgent one: a system reachable from the internet with a single factor is a system waiting for one reused password to matter.

IT Service Desk

Internal requests — a laptop, an account, access to something — as tickets with an owner and a resolution. The same shape as the customer Helpdesk in CRM, pointed inward, and honestly a different product from the one this system is for.

Second Proof at Sign-in

Password & Secret Management

Password & Secret Management

Where shared credentials live so they stop living in a message thread, with who may retrieve which one recorded. This system never asks for a marketplace, bank or account password of its own; this app is about the credentials a business already has to hold for other things, and the fact that they are currently held badly.

Security Analytics

Sign-ins, failures and unusual patterns, read from the audit trail that already records everything. It needs no new capture because the record is already being kept — what is missing is anybody looking at it, which is what this app would be.

BUILT DEEP, NOT WIDE

The controls that pay for the software

Three-way match

A supplier bill only passes when the purchase order, the goods receipt and the invoice agree on price and quantity. Bills that over-charge or over-bill rejected goods are held automatically, with the reason in plain language.

Vendor risk that sees ahead

Risk blends weak performance, spend concentration and overdue bills. Your *best* supplier still flags medium risk when 44% of your buying sits with them — the fact worth knowing before a disruption, not after.

Settlement reconciliation

Import a marketplace settlement, match it to the orders, and see every commission, TCS deduction, weight discrepancy and short payment — with a claim pack ready to file.

Piece-rate and contractor pay

Pooled completion, per-unit rates, rework hours and advances roll into one payout for anyone paid by output rather than by the hour — and into a true cost per unit for every product.

One stock number

One quantity per SKU per location per stage, pushed to every channel. Overselling stops being a monthly apology.

AI studio built in

Listings, ad copy, product photography and reels generated against your own catalogue — not a bolted-on chatbot, but the same data core.

INDUSTRIES

One engine, any industry

Every app ships in two builds: a neutral unified-ERP configuration, and an industry configuration. The engine, formulas and tests are identical — only the master data differs.

Textile & apparel

Mills and trim suppliers, fabric in metres and pieces in numbers on one item master, piece-rate pay, design-wise costing, HSN 5007/5208, marketplace returns and wrong-return dead stock.

Medical & pharma

Distributors, batch and expiry tracking, QC pass rate as accept rate, cold-chain locations, and a regulated document trail nobody can quietly edit.

Manufacturing

Component suppliers, multi-level BOM, fill rate driving line stoppages, work orders, scrap and rework accounted where they happen.

Services

Subcontractors, milestone acceptance in place of goods receipt, timesheets, retainer billing and project profitability.

Drone & precision

Serial and lot tracking to the individual unit, calibration as a production stage you define, and certification paperwork filed against the batch it belongs to.

Law firms

A matter instead of an order: hearings, filings, opposing parties and e-signed engagement letters on one record. Time against the matter becomes the bill.

Chartered accountants

Clients, engagements and statutory deadlines in one calendar; staff hours costed per engagement; the practice's own books kept in the same system.

Trading & export

Multi-warehouse stock with one number, credit limits and ageing per buyer, commercial invoice, LUT bond and IGST refund — plus every channel in one queue.

Clinics & healthcare

An appointment is an order and a chair is a resource. Sessions, locums and retainers land in one payout register; licences and calibration are tracked with the evidence attached, not a tick in a box.

Restaurants & hospitality

A recipe is a bill of materials and a cover is a forecast. One stock number across kitchens, rotas that fill before the shift starts, and wage cost read against sales as it happens.

Education & training

A learner is a customer whose record runs from enquiry to alumnus. Cohorts are projects, fees are instalments, and admissions spend is judged on enrolments rather than on clicks.

Construction & sites

A site is a project with stages that get certified. Retention tracked to its release date, material ordered against a requirement, and cost booked to the site that incurred it.

Logistics & freight

A consignment is an order that moves. Bonded cargo is a location, demurrage is an ageing report, and what the carrier billed is checked against what was actually packed.

Field service

A job is a work order that travels. Van stock is a location like any other, parts fitted are booked to the job, and a callout is never invoiced without a signed sheet.

Food & agriculture

A batch is a production order with a yield. Intake traces back to the farms that supplied it, and nothing is released before its test comes back.

Agencies & studios

A retainer is a contract with rounds in it. Time books to the client that used it, deliverables carry the scope they belong to, and an extra round is a conversation before it is a cost.

COMPARISON

Medhava vs. a suite of integrated apps

The difference is architectural, not cosmetic.

CAPABILITY	MEDHAVA	TYPICAL SUITE
Architecture	One app, one data core	Many apps, integrated
Master data	Single Item & Party record	Duplicated per app, synced
Stock truth	One number per SKU × location	Per-app, reconciled nightly
Cross-module posting	Instant, via event bus	Scheduled sync jobs
Marketplace settlement	Reconciled to order line + claim pack	Usually a separate tool
Piece-rate manufacturing	Built in	Custom development
AI content & imaging	Native, on your catalogue	Third-party add-on
Offline capability	Single-file apps run offline	Cloud-only

TRUST & SECURITY

Your credentials are never the key

Scoped keys only

Marketplace, bank and courier connections use revocable, scoped API keys held in an AES-256-GCM vault. Medhava never asks for, uses or stores an account password.

Isolation by row

Every record carries a company id and is enforced by PostgreSQL row-level security. Group companies stay separate but consolidate on demand.

Immutable audit

Every posting, price change and permission grant is written to an append-only trail with actor, timestamp and before/after values.

THE GAP

Three categories of software. Nobody sells all three.

You are not short of tools. You are short of one tool that covers all of it —
which is why the numbers never agree.

Accounting & ERP suites

a desktop accounting package · a desktop accounting package · a desktop accounting package · a business-suite vendor · an open-source ERP

- ✓ Books, GST, stock, purchase
- ✓ Manufacturing, payroll
- ✗ No marketplace order queue
- ✗ No settlement reconciliation or claims
- ✗ No content, image or video studio

Marketplace OMS platforms

an e-commerce operations suite · EliteSecom · SmartHub

- ✓ Panel orders in one queue
- ✓ Inventory sync, settlement
- ✗ No double-entry books, no GST return
- ✗ No manufacturing, purchase or payroll
- ✗ No content, image or video studio

AI content tools

Writing · image · video generators

- ✓ Copy, pictures, reels
- ✗ Knows nothing about your catalogue
- ✗ No orders, no stock, no books
- ✗ Nothing publishes to a channel
- ✗ Nothing reconciles afterwards

Medhava

All three, over one data core

- ✓ Books, GST, stock, purchase, manufacturing, payroll
- ✓ Marketplace and storefront order queue
- ✓ Settlement, claims, returns, packing footage
- ✓ Content, image, design and video studio
- ✓ One record underneath all of it

In an accounting package you will never get a marketplace OMS. In an OMS you will never get your books. In a content tool you will never get either. That is the gap. Medhava is built in it.

THE APPROACH

Built deep, not wide

A long feature list is easy. What is hard is the one control that stops the money leaking — so every module ships with one, and refuses rather than warns.

01

Accepted, not ordered

You order 100. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. Medhava raises stock by 96, claims credit on 96, raises a debit note for the 4, and lowers that supplier's accept rate. Automatically.

02

The payout, to the order line

Not "the channel paid ₹49.1 lakh". Which order line was short, by how much, against which published commission rate — with the claim pack already assembled and the packing footage attached.

03

Nothing derived is stored

Outstanding, ageing, promise dates, payouts, on-time percentage and risk are recomputed every time you read them. A stored number goes stale the moment the document under it changes. These cannot.

PRICING

Start free. Pay when it runs your business.

The software puts no ceiling on how many companies you run — your plan does, and you move up when you need to. Two of the 30 modules — E-commerce / OMS and the AI Content Engine — are priced on what you actually use, because an order is work and a piece of content is work.

Yearly **SAVE 33%** Monthly

- ✓ Unlimited users, 20 companies
- ✓ Manufacturing & piece-rate payroll
- ✓ Group consolidation
- ✓ SSO, audit export, custom SLAs
- ✓ Dedicated success manager
- ₹ OMS charged per order
- ₹ AI Content charged per content

Talk to sales

E-commerce / OMS & AI Content Engine

These two are metered, the way every serious order-management platform prices. You pay for orders that actually shipped and content that was actually produced — not for a seat that sat idle.

E-commerce / OMS

PER ORDER PROCESSED

ORDERS A MONTH	PER ORDER	INCLUDED
Up to 1,000	₹2.50	All channels, settlement, returns
1,001 – 10,000	₹1.80	+ claims desk, packing footage
10,001 – 50,000	₹1.40	+ multi-warehouse routing
Above 50,000	On request	+ dedicated throughput
An order is counted once, when it is dispatched. A cancelled or unshipped order is never billed.		

AI Content Engine

PER PIECE PRODUCED

WHAT IS PRODUCED	COUNTS AS	RATE
Channel listing (title, bullets, description)	1 content	₹6
Social post, caption or ad variation	1 content	₹4
Product image · background, resize, preset	1 content	₹3
Reel or video cut, per finished clip	1 content	₹25
Bring your own model key and the rate drops to the platform fee alone — no lock-in, ever.		

REQUEST A DEMO

Bring one month of your own data

Sales, purchases and stock for a single month. In forty minutes you will see what your current tools are hiding — the short payouts, the returns nobody costed, the stock that two systems disagree about.

- ✓ No obligation and no card details
- ✓ Your data stays yours — we work on a copy and delete it after
- ✓ You leave with the numbers, whether or not you buy

We reply within one working day. Medhava will never ask you for a marketplace, bank or account password.

QUESTIONS

Frequently asked

What is Medhava?

Medhava is a unified ERP made of 30 modules and 165 apps that all read and write one shared data core — Item/SKU, Party, Stock, Ledger and Order. Because the data is shared, a single action such as a goods receipt updates stock, the ledger, quality records and the vendor scorecard at the same time.

How is Medhava different from a business-suite vendor or an open-source ERP?

Does Medhava support Indian GST?

Which marketplaces does Medhava connect to?

Can Medhava be used outside textiles?

Is my data safe?

Can I use it without internet?

Stop reconciling. Start running.

See your own numbers inside Medhava. Bring one month of sales, purchases and stock — we will show you what your current tools are hiding.
