

VASTRANGAM
EDITION

Purchase is live — Procurement + Vendor
Management →

Run the whole ethnic wear house on one system

Mill to marketplace in one application. The metre you bought, the karigar who stitched it, the design that sold on Myntra, the return that came back damaged and the GST on all of it — one record, one stock number, one set of books. Nothing re-keyed between them.

Start free for 30 days

- ✓ Free for 30 days
- ✓ No card details
- ✓ Works with the internet off
- ✓ GST, TDS & TCS ready

30

Modules, one login

165

Apps over one data core

1

Stock number for every SKU

7

Marketplaces connected

WHAT VASTRANGAM BOS IS

One application. Not eleven that talk to each other.

Every other suite sells you separate products and a sync job between them. Vastrangam BOS is a single application over one set of records — so there is nothing to synchronise, and nothing to reconcile.

1

Enter it once

A goods receipt, a counter sale, a marketplace order — recorded in one place. Stock, the ledger, the quality record and the supplier scorecard all update in the same instant, because they are reading the same record.

2

Numbers that cannot disagree

One stock figure per SKU. One ledger. One order record. Not a copy per channel that somebody reconciles on Saturday. When the website says four are left, four are left.

3

Built for how India actually runs

GST with input credit on accepted goods, TDS and TCS, seven marketplaces, piece-rate karigar wages — and apps that keep working when the internet does not.

WHAT CHANGES FOR YOU

The same day, before and after

Nothing here is a new way to run your business. It is the work you already do, arranged so that it only has to be done once.

TODAY

- ✗ Log into seven seller panels, one at a time
- ✗ Copy each order into a sheet, then into the books
- ✗ Guess which stock figure is the real one
- ✗ Learn at month-end that a mill over-billed you
- ✗ Chase a marketplace shortfall you spotted six weeks late
- ✗ Ask three people for their file before you can see one number

WITH VASTRANGAM BOS

- ✓ One queue, sorted by whichever order is closest to being late
- ✓ The order writes itself into stock and into the ledger
- ✓ There is one stock figure, so there is nothing to choose between
- ✓ An over-billed invoice cannot be paid — the match refuses it
- ✓ Every shortfall is on a screen the day the payout lands
- ✓ Open the dashboard. It was already up to date.

Vastrangam BOS at a glance

What it is	A unified ERP: 30 modules and 165 apps sharing one data core and one event bus.
Shared data core	Item/SKU · Party · Stock · Ledger & Voucher · Order — every module reads and writes these.
Key difference	Not a suite of integrated apps. One application, so there is no sync step and no duplicate master data.
Compliance	Double-entry accounting with CGST/SGST/IGST, TDS, TCS, ITC on accepted goods, GSTR-1 and GSTR-3B.
Channels	Amazon, Flipkart, Myntra, Meesho, Ajio, Nykaa, JioMart, plus the storefront platform and a self-hosted storefront platform.
Security	PostgreSQL row-level security per company; integrations use revocable scoped API keys in an AES-256-GCM vault — never account passwords.
Deployment	Hosted multi-tenant cloud, or single-file offline apps that run by double-clicking with no install.

THE PROBLEM

Your business runs on eleven tools that don't talk

Accounting in one place, stock in a spreadsheet, marketplace orders in seven seller panels, karigar wages in a notebook. Every month-end becomes an archaeology project.

Numbers that disagree

Stock says 40, the marketplace says 12, the books say something else again. Nobody knows which is right, so everyone guesses.

Work entered three times

The same invoice keyed into the seller panel, the spreadsheet and the accounting package. Three chances to be wrong.

Money quietly leaking

Over-billed purchases, unclaimed marketplace shortfalls, RTO losses — invisible until the year is over.

HOW IT WORKS

One data core. One action cascades everywhere.

Every module reads and writes the same five entities. That is the physical reason a single goods receipt can touch stock, books, quality and sourcing at the same instant.

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems increase stock by 100 and claim tax credit on 100. Vastrangam BOS increases stock by 96, claims input tax credit on 96, raises a debit note for the 4 rejected, and lowers that mill's accept rate — automatically.

Nothing derived is ever stored

Outstanding, risk, performance, ageing, profit per product — all recomputed on read. They cannot drift out of step with the documents underneath them.

WHERE THE BUILD STANDS

16 apps working today,
2 more with their engine
running. 147 still to build.

Nothing on this page is called finished unless it is. Every app further down carries a badge saying which it is, and the counts here are counted from the module list each time this page is built — never typed in.

The honest count

Modules	30 business modules, plus the Platform spine underneath them — 31 numbered in build order
Apps	165
Working today	16 — each carries its own self-tests and is checked in a real browser, in both editions
Engine working, screen to come	2 — the hard part is written and passing its own tests on the command line, but there is no screen yet, so they are not counted above
Still to build	147 — designed and specified, not yet written
Build order	Dependency order: a module is started only once everything it needs already exists
Companies	Vastrangam (invoices VS) · Ethnic Fashion trading as Go4Fashion (invoices EF, SKUs EF) · Adini Couture (invoices AC)

THE ONE IDEA

Every module reads and
writes the same six records.

That is the physical reason a single goods receipt can touch stock, the books, quality and sourcing in the same instant — not a promise about integration, a consequence of the design.

One stock number, not one per channel

The last piece sold at the Surat counter disappears from Myntra and Flipkart in the same instant — not three hours later as a cancellation, because cancellations are what a seller rating is lost to.

Accepted — not ordered — is what counts

You order 100 metres. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. This one raises stock by 96, claims input credit on 96, raises a debit note for the 4 rejected, and lowers that mill's accept rate — automatically.

Nothing derived is ever stored

Outstanding, ageing, risk, promise dates, cost per piece and profit per design are recomputed on read. A stored total can drift away from the documents underneath it; a computed one cannot.

COMPANIES AND CHANNELS

Three companies and seven marketplaces is your data — not a ceiling.

A company is a row. A channel — a marketplace account, the D2C site, the counter, the B2B desk, an export buyer — is also a row.

Every record carries the company it belongs to and every sale carries the channel it came through, so ten companies selling on ten channels each is the same tables and the same code as three and seven.

What is fixed, and what is not	
Companies	A row each. The software sets no limit of its own.
Channels	A row each. The eleventh marketplace is a row, not a release.
Stock	One number per SKU. Never one per channel.
The group figure	The sum minus inter-company trade, with the elimination shown.

Each company's books are its own

Its trial balance balances on its own, and no journal line can point at an account belonging to a different company. That is checked by a test, not left to discipline.

The group is the sum minus what you sold yourselves

A sister company buying from a sister company is revenue in one set of books and cost in another. Adding the companies up would report turnover the group never earned from the outside world, so every entry naming a sister company is eliminated — and all three figures are returned, so you can see the elimination rather than trust it.

The channel is a dimension of the sale, never of the stock

Read any month by channel, by company, or by both. What you cannot keep is a separate stock number per channel — the last piece sold on one marketplace has to vanish from the other ten in that instant, which per-channel inventory cannot do.

Checked, not claimed. The core test posts across a 10 × 10 grid — a hundred channels — and asserts every company's books balance, that no line reaches into another company, and that the group is ₹2,10,500 gross minus ₹50,000 inter-company = ₹1,60,500. It then runs 11 × 11 with nothing in the code changed. In the working Dashboard & BI app you can add the fourth company and the eleventh channel yourself and watch every figure hold.

THE PROOF

One garment. Eight modules. One database.

The test of whether this is one system or 165 programs sharing a login: sell a single garment and follow it. Every step below is the same record, moving — nothing is re-keyed between them.

15 · Order lands in one queue

03 · Stock down on every channel

10 · Picked from the named bin, filmed

11 · Courier booked, COD banked

12 · Revenue and GST posted

14 · Payout matched to the paise

08 + 16 · The karigar paid for it

21 · Every figure clicks back down

HOW IT WORKS, IN USE

A walkthrough

Everything above says what the system is. This follows a design through it, because "31 modules over one shared data core" is a true sentence that tells you nothing about your Tuesday.

Every screen below is a real render of the software, not an artist's impression — the same markup and the same stylesheet the product uses. The figures on them are illustrative.

Where you are starting from

You are not starting empty, and that is the whole difference. There is a working house here: three companies, nine panels, a counter, an export book and people who are paid by the piece. So the first month is a parallel run, not a switch that gets thrown.

Masters first

Opening balances at the cutover

One month in BOTH sets of books

They agree to the paise

The old system goes read-only

The gate is that the two agree to the paise, and where they do not, the reason is named rather than the number quietly adjusted. A cutover that cannot reproduce last month is not a cutover.

A day in the life — one design, followed to the money

It sells on a panel

MODULE 15 · E-COMMERCE / OMS

Nine panels land in one queue. It is sorted by the time left on the cut-off, not by when it arrived — so the Myntra order that has to leave in forty minutes

Panel queue · 9 channels · cut-off running

TO ACCEPT
62

TO PACK
214

CUT-OFF IN 2 H

HANDED OVER TODAY

sits above the one that came in this morning and has all day.

The design record moves

MODULE 03 · INVENTORY & CATALOG

One design, one stock number, and each panel's own code for it mapped to yours. The piece that just sold is gone from every other panel in the same instant, which is the only thing that stops the cancellation a seller rating is lost to.

It is picked in the godown

MODULE 10 · WAREHOUSE

A wave in walking order, zone A to C, confirmed against the bin it came from. A short pick stops the pack rather than quietly shipping the order light.

It goes to the courier

MODULE 11 · LOGISTICS

The rate is checked against the packed weight before booking — which is where weight disputes are won — and COD collected at the door stays a receivable until it is actually in the bank.

The books post themselves

MODULE 12 · ACCOUNTING & GST

Revenue and GST through one posting engine. Entries balance or they do not post. There is no third option and no month-end hunt for the one that did not.

The month that pays people

This is the part most systems get wrong, and it is worth its own step.

Staff and karigars in one register

MODULE 16 · HR & PAYROLL

Monthly salary and per-piece earnings sit in the same register, with attendance driving both. Sets are pooled across every karigar before the minimum is taken — count the sets per karigar row and add them up, and every set completed by two people between them disappears. A missing rate posts zero and is flagged by name; it is never guessed, because a guessed rate is a wrong payment to a real person.

This month's register · staff and karigars				
ON ROLL		PRESENT TODAY		
86		79		
ADVANCES OUT		PAYOUT DUE		
₹2.4 L		₹28.6 L		
PERSON	BASIS	DAYS / PIECES	EARNED	STATE
A. Deshpande	Monthly	26	₹64,000	Approved
S. Kulkarni	Monthly	24	₹41,500	Approved
Unit 3 karigars	Per piece	1,240	₹1,86,000	To check
R. Nair	Monthly	26	₹52,300	Approved
Attendance marked on time				97%
Payouts released on the 7th				100%

The document a payout is discussed from carries the rules, never the roster: the formula, the thresholds and the reason, with no individual's pay attached to a shared file.

Month end

What the money is doing next

MODULE 13 · TREASURY & FINANCIAL PLANNING

Receipts due, payments committed, and the fortnight ahead — so a festive buy is decided against the cash that will actually exist, not the cash in the account this morning.

Cash position · next 14 days			
CASH + BANK		DUE OUT	
₹38.4 L		₹44.2 L	
EXPECTED IN		TIGHTEST DAY	
₹52.6 L		Day 8	
WHEN	OUT	IN	RUNNING
This week · mill payments	₹18.4 L	₹21.2 L	₹41.2 L
Karigar payout, day 8	₹14.6 L	₹4.1 L	₹30.7 L

And the group figure, honestly

MODULE 21 · DASHBOARD & BI

Each company's books are its own and balance on their own. Selling from one company to another is revenue in one set and cost in the other, so adding the three up would report a turnover the group never earned outside. Every inter-company entry is eliminated, and you are shown all three numbers — gross, eliminated, group — rather than asked to trust the last one.

Then the next month opens, and nothing about the close depended on anybody remembering to run it.

WHEN	OUT	IN	RUNNING
Marketplace payout, day 11	—	₹18.4 L	₹49.1 L
GST + salaries, day 13	₹11.2 L	₹8.9 L	₹46.8 L

Identity, Settings & Audit

to build

Users, roles and permissions, company switching, tax and numbering setup — and an immutable record of everything that ever happened.

Industry Packs

to build

What your trade calls things, the stages your work moves through, the extra fields your records need, the documents you issue and the reference data you start with — all of it loaded as a row of configuration, never as a separate version of the software. Pick the pack that matches your trade and the whole system changes its words: the same order screen reads as a job, a matter, a consignment or an appointment, with the same columns underneath. A pack may rename what exists, add fields to tables that exist, and switch discretionary rules off; it may never invent a concept, add a field to a table that does not exist, contain any executable code, or switch off the guarantees — company scoping, the audit trail, money never being a float — because a trade may change its vocabulary and may not opt out of the things the books are trusted for. Adding a trade nobody anticipated is therefore a file somebody writes, not a release somebody ships.

Ask & Print

WORKING TODAY

At an exhibition in Hyderabad, send one line from your phone: “ledger Kalamandir”, “print slips”. It comes back as a PDF, or it prints at the Surat office — with nothing plugged into your phone and nothing at the office open to the internet.

Communications

to build

WhatsApp commands and broadcasts, email and SMS, and the handful of scheduled jobs that carry a nudge to the right person without anyone remembering to send it. Every capability here has more than one interchangeable provider — none of them is ever the source of a figure the business reports.

WhatsApp Command Console

to build

The shop floor does not open a laptop. A karigar or a staff member sends a short message — in, out, today’s pieces, leave, an advance — and it becomes a real record: attendance with the time and place it was marked, a production report against the design, a request in the approvals queue. The end-of-day prompt asks what is still open and how long it needs, so tomorrow starts from what is actually pending rather than from memory. Marking attendance checks the phone is at the unit within the radius set for it, with a grace window; a person outside it is not refused, they are flagged for the manager, because a system that locks someone out of being paid for being early at the wrong gate has failed at its job. Every override is recorded with who made it. The words a worker types are in the language they speak, and nothing here ever asks for a password, a bank detail or a document number.

Data Privacy & Consent

to build

What a person’s data may be used for, captured as consent at the point it is given and honoured everywhere downstream — including the right to have it corrected or removed. Retention (how long a record is kept) and deletion (a person’s right to have their own data removed) are two different policies, tracked separately, because a rule that keeps records for the law and a request from a person to be forgotten do not resolve the same way.

Provider Router & Cost Guard

ENGINE WORKING · SCREEN TO COME

The rule that no capability depends on one outside service, enforced at the moment it matters instead of merely promised. Every capability has an ordered fallback list ending on an option that needs nothing connected, so a courier API that stops answering at 9pm, or an AI key that hits its quota mid-catalogue, drops to the next option instead of stopping the work. A provider that keeps failing is tripped out of the list entirely and retried once after a cooldown rather than hammered; retries inside one provider wait twice as long each time. And every paid call is counted in paise against a ceiling you set — over the ceiling the paid provider is refused, not warned about, and the work completes on a free one. Because every capability is guaranteed a built-in or by-hand option, a spent budget can stop the spending without ever stopping the business.

Payment Data Scope

to build

A written statement of exactly which systems ever see a card or bank credential, and which never do — because every card-capable screen in this system hands that moment to a payment provider's own secured field and never stores or even passes the number through application code. The statement is what an auditor or a partner asks for before they will connect to this system.

Appearance & Localisation to build

The two settings a person notices in the first minute and nobody writes a specification for: which time zone a screen shows its dates in, and whether it is drawn light or dark. Time zone is the one that matters for correctness rather than comfort — every timestamp in this system is stored as an absolute moment, so a business working across two zones reads the same event at the right local time in both, and a working day that ends at midnight ends at midnight where the work happened.

Design & Sampling

MODULE 02

2 APPS

A style exists on paper before it exists as stock

A product moves from a first idea to something the business can actually make and sell — specification, sample rounds, costed trials and sign-off — before it is ever entered as a catalog record. Building this first means Inventory & Catalog never has to invent a style it has no real specification for.

READS FROM

CRM

WRITES TO

Inventory & Catalog

Manufacturing

PLM & Development

Design / IP Register

PLM & Development to build

Concept to a design that can actually be made: fabric and trim specification, sample rounds with the mill, costed trials against a target price, and sign-off — every version kept, so last season's costing is still there.

Design / IP Register to build

What protects a design once it exists — trademark or copyright status, the date it was first shown, and a flag the moment a near-identical listing turns up elsewhere. Every version already kept by PLM & Development gets a filed status here instead of just a date stamp, because a design with no ownership record on file is a design nobody can defend.

Inventory & Catalog

MODULE 03

4 APPS

One stock number everyone trusts

The most important number in the house: one quantity per design and size, per godown, per stage — greige, dyed, in stitching, finished, listed. Read and written by every other module. And one product record every marketplace lists from.

Codes mapped on every live panel		95%
Size and weight on file		98%

Stock to build

Live quantity by design, size and location, fabric in metres and pieces in numbers, with reorder alerts, lot tracking, set kits and dead-stock ageing.

Catalog / PIM to build

One record per design — fabric, work, length, colour, size chart, images, HSN, MRP and what each panel actually sells it at — scored for Myntra and Amazon readiness before it lists. It also carries the two things everything downstream needs: the code each panel knows the design by, mapped to yours, and the packed size and weight that decide the courier rate and settle every weight dispute. Every listing's state on every panel is here too — live, waiting for approval, blocked, archived — with the quality score that decides whether anyone sees it.

Kit & Combo SKU to build

A sellable SKU made of component SKUs — a three-piece set sold as one listing. Selling the kit decrements each component at order time, so stock is right for every piece in the set, not just the set itself.

Master-Data Hygiene to build

Duplicate detection and merge across customers, vendors and designs, and a dead-stock register for what has not moved in months. Protects every downstream report from the same record existing twice under two names.

CRM MODULE 04 5 APPS

Know every boutique, chain and customer completely

One record per party — a Kalamandir or a Rajmandir, a Surat walk-in or a Myntra buyer — carrying every enquiry, order, return, agreement and conversation, whichever channel it arrived on.

CRM & Customer 360

Documents & eSign

Helpdesk & Live Chat

Forms & Feedback (NPS)

Territories

CRM & Customer 360 WORKING TODAY

Enquiry to confirmed order, then the full lifetime: what they bought, what came back, what they are worth and which new range to show them first.

Documents & eSign WORKING TODAY

Mill agreements, job-work contracts, signed delivery challans, export documents and boutique credit terms filed against the party or order they belong to — found by that record, not by hunting through a folder.

Helpdesk & Live Chat WORKING TODAY

A boutique asking where its parcel is, or a customer asking about a size — the question becomes a ticket tied to the order, with the whole history already open.

Forms & Feedback (NPS) to build

A short form after delivery, and the score it produces attached to the design or item it is actually about — not just the buyer — so a complaint-prone item surfaces as a pattern instead of a scatter of individual gripes.

Territories to build

Dividing customers and targets by region or by team, and reporting against that division. Worth having the moment there is a sales team large enough to divide and an argument about whose account something was; pointless before that. A territory is a row like anything else here, so redrawing the map is an edit rather than a migration, and last year's figures stay readable against last year's boundaries instead of being silently restated under the new ones.

Sales MODULE 05 9 APPS

Counter, wholesale, website and export — one order book

The Surat counter, the boutique wholesale book, the website and the export shipment all write to the same order and draw on the same stock number. And the parcel is followed to the door, because a sale is not done until the COD money is in.

Order book · counter, boutique, website, export

D2C Sales

WORKING TODAY

Orders from your own storefront, cart to dispatch, with loyalty and partial COD on a ₹4,400 anarkali.

Export

WORKING TODAY

Commercial invoice, packing list, LUT bond and IGST-refund tracking for the Gulf and UK buyers.

Quotes & Proforma

WORKING TODAY

Send a quote, convert it to a confirmed order in one click.

Subscriptions

to build

A schedule that raises its own invoice on its cycle and follows up on its own when a payment fails — for anything sold as a standing order rather than a one-off.

Appointment Booking

to build

A slot a customer books for themselves — a fitting, a consultation, a service visit — against the real availability of whoever or whatever is needed for it. It writes to the same Calendar the rest of the business works from, so a booking taken on a website at midnight cannot collide with something already in the diary.

B2B & Credit

WORKING TODAY

Boutique and chain orders on credit limits and tier pricing, with outstanding aged against each party's own agreed terms.

POS

WORKING TODAY

Counter billing at Udhna that draws on the same stock as the website — no second stock register.

Couriers & AWB

to build

Book the parcel on the order, compare couriers for that pin code, print the label with the design code on it, and follow the AWB to the door.

Customisation & Made-to-Measure

to build

The order that does not exist in the catalogue: a buyer sends reference pictures and their own measurements, a price is agreed over several messages, and the piece is made for them. All of it is one record — the references, the measurement set, every quote in the negotiation and what was finally agreed, the advance taken to start work and the balance taken before dispatch. When the order is accepted it opens a production order like any other, so a bespoke piece is costed, stitched, checked and posted exactly as a catalogue piece is. Two legs of money on one order is the part most systems get wrong: the advance is earned when the work starts, the balance is owed until the piece ships, and the ledger shows both separately rather than one payment appearing when the whole thing is over.

Planning & Requirements (MRP)

MODULE 06

3 APPS

Turn what is selling into what to buy and make

Confirmed orders and demand history have to become a plan before Purchase can buy anything or Manufacturing can start anything — otherwise buying and making are both just guessing. This module sits between the two: it reads what is actually selling and what is already committed, and turns that into requirement, not the other way around.

0%

Demand Forecast & Signal

to build

What sold, by SKU and by period, turned into a short-term forecast — the number every requisition and every production order downstream is measured against instead of a guess.

Open-to-Buy / Budget Ceiling

to build

A spending ceiling set per period regardless of what the demand signal suggests, so a real signal cannot on its own commit more money than the business has decided to risk this season. Every requisition the MRP run drafts is checked against what is left of the ceiling before it goes to Purchase.

Requirement Explosion (MRP run)

to build

Confirmed demand exploded through the bill of materials into what raw material to buy and what to produce, and by when — so a purchase requisition or a production order always traces back to real demand, never to a feeling that stock is getting low.

Purchase

MODULE 07

- Fleet

Rates & Zones

to build

Every courier's rate card by zone, weight slab and service — so the cheapest and the fastest option for this parcel are both known before it is booked.

COD Remittance

to build

What the courier collected at the door against what reached the Surat account, parcel by parcel, with every shortfall named and aged.

Fleet

to build

Your own delivery vehicles, if you run any — what each trip cost, what is due for service, and what that adds to freight. Optional; most businesses run couriers only.

NDR & RTO Rescue

to build

A failed delivery worked while it can still be saved — reattempt, call, correct the address — before it becomes a return you pay for twice.

Handover & Manifest

to build

What is expected out today against what the pickup boy actually took, per courier and per service. The manifest to hand him, the one-time code to confirm it, and a signed note of what was left behind — so a parcel lost between the packing table and the van has an owner.

Accounting & GST

MODULE 12

9 APPS

Books that always balance — and no a desktop accounting package needed

A full double-entry ledger built for Indian compliance, keeping the books itself. B2B sales, returns, mill purchases, payments and receipts are entered by hand because a person decides them; every website, marketplace and counter sale posts itself.

Fixed Assets & Depreciation

Year-End Close & Period Lock

Finance Reports

**Accounting**

to build

Double-entry books where every voucher balances and the trial balance always ties.

**Expenses**

to build

Spend captured by category with approvals, and bill OCR to save typing.

**ITC Reconciliation**

to build

Every input credit matched against the government's own GSTR-2A/2B before a return is filed, so a credit claimed is a credit that is actually on record.

**Fixed Assets & Depreciation**

to build

The asset register with both Straight-Line and Written-Down-Value depreciation tracked side by side, and disposal posting its gain or loss straight to the books.

**Finance Reports**

to build

P&L, balance sheet, and profit by channel, design and SKU — so you know which anarkali actually earned money after commission, shipping and returns.

**Invoicing**

to build

GST tax invoices and receipts, worked out from the lines to the paise. Where a panel raises its own invoice you keep both numbers on the order — theirs and your own series — so the panel's paperwork and your books point at the same sale.

**GST & Tax**

to build

CGST, SGST, IGST, TDS, TCS, input credit, GSTR-1 and GSTR-3B — filed per registration, so a group where one company is registered and another is not files exactly what each one owes and nothing it does not.

**Receivables, Payables & PDC**

to build

Payments and receipts allocated against named open invoices, and a register for post-dated cheques that posts only on the date they are realised, not the date they were written.

**Year-End Close & Period Lock**

to build

Profit-and-loss accounts reset and balance-sheet accounts carry forward at year end, and a reviewed period locks against backdated edits until an admin unlocks it — an act that is itself logged.

**Treasury & Financial Planning**

MODULE 13

3 APPS

Know what cash is coming, not just what already arrived

Accounting records what happened; this module is concerned with what happens next — how much cash is actually expected, when, and whether spend against a budget is on track before the month closes and turns the answer into history.

Commission charged as published

86%

Claims recovered

63%

Fee & Commission Audit to build

The commission a panel publishes for a category against what it actually took, style by style. A quiet rate change is caught the first time it is applied, not at year end — and your seller tier sits on the same screen, because the tier is what the rate card hangs off, and slipping out of one quietly costs more than any single deduction.

Seven panels, one queue — and every rupee accounted for

Stop logging into Myntra, then Flipkart, then Ajio. Every marketplace order lands in one pipeline and your stock goes out to all of them — then the money side closes out in the same module: what the panel paid, what it kept as commission, what came back, and what it still owes you.

AR / Virtual Try-On

Marketplace OMS

WORKING TODAY

Myntra, Flipkart, Ajio, Amazon, Meesho, Nykaa and JioMart in a single queue — processed all together, channel-wise, or design-wise. The stages the panels really use, with the right cut-off counting down on each order — a quick-commerce or air-shipped order is not due at the same hour as a standard one. Priority orders at the top, and the day grouped by design so a VarunKotecha Purple is picked once for eleven parcels instead of eleven times.

Manual Data Check

to build

The order and return sheets you already download from the panels, and the offline registers from the three shops — one file or a whole ZIP — read back as ten cross-checks: net sale after commission and fees, month, design, state, wrong returns, SPF claims, ads, payouts and GST. Every figure clicks through to the transactions behind it.

Claims & Disputes

to build

Weight disputes, SPF shortfalls, parcels lost in transit and returns that came back with a different piece inside — filed as claims with the packing footage attached, and answered before they close. A claim awaiting your reply is money; one closed for no response is nothing, so the days left sit beside the amount.

Channels & Storefronts

to build

Connect a channel once and it stays in step: catalogue out, price out, stock out, orders in. Seven marketplaces and any website platform — any hosted, self-hosted or custom site over its own API — each switchable without touching your data. Shopsy and any other storefront a channel runs alongside its main one counts as its own channel here. Where a channel has no open interface, its own downloaded report is a first-class way in. A channel may also know you by a different trading name — that is a label on the channel, not a second company, so it tags the order and the payout without ever splitting your books.

Listing & Catalog Manager

to build

Bulk-create and bulk-edit listings across every channel from the one product record in Inventory & Catalog, and catch the mismatches that quietly cost sales: listed but out of stock, or in stock but never listed.

AR / Virtual Try-On

to build

A way to see drape, fit and colour on a screen before buying, for items where a flat photo alone leaves too much to guess.

Order Management

WORKING TODAY

One pipeline from new to delivered, whether the order came from a seller panel, your own storefront site, a dealer or the counter.

Reconciliation

to build

Match every marketplace payout to the order line that earned it, and expose the gap.

Returns / RMA

to build

Customer returns, courier returns and wrong returns kept apart — because only one of the three is really your fault, and only one of them turns into dead stock.

Labels & Documents

to build

The panel gives you a PDF; this hands the packing table something it can work from. Cropped to 4×6 for every channel, your design code printed large where the panel left it off, the invoice and slip merged behind it, and the whole batch to the label printer in one job. Reprint one parcel without redoing the lot — and no customer's name and address is ever uploaded to an outside website to be cropped.

Size / Fit Recommendation AI

to build

A fit suggestion at the point of purchase, built from the item's own measurements and the return history of buyers who picked each size — aimed straight at the return reason that costs the most: the right item in the wrong size.

Pay everyone right, on time

Office staff on a monthly salary and karigars paid by the piece, in one register, with attendance driving both and the festival advance already deducted.

Payouts released on the 7th

100%

Staff & Contractors to build

Attendance marked by tap, effective-dated salary, and karigar piece-rate earnings in a single register.

Appraisal & Hiring to build

Performance reviews and a hiring pipeline that ends in an employee record.

Payout Execution to build

Where the calculation in the earnings register actually turns into money leaving the business — bank batch, UPI, cash against a signed receipt — with the method and the reference recorded against every payout, so the register's total and the money that actually moved can always be checked against each other.

Time-off & Advances to build

Leave, Diwali advances, and exactly how they change this month's payout before you approve it.

Recruitment to build

The pipeline before someone becomes an employee — an opening, the people who applied for it, a trial piece where the work itself is the interview, and the decision with its reason kept. It matters more here than in most trades: a karigar is taken on for skill on a particular garment, and the trial output is the evidence, so it is recorded against the design and the rate that would apply rather than remembered as an impression. A candidate who is not taken on now stays findable when the same skill is needed in a busy month, and their personal documents are held under the same consent and retention rules as anyone else's, not in a folder on somebody's phone.

Employee Engagement & Surveys to build

Asking the people who work here how it is going, and keeping the answers where a pattern can be seen rather than in one manager's memory. Anonymity has to be real to be worth anything: a survey that quietly identifies its respondents produces polite answers and no information, so where a response is promised anonymous it is stored unlinked from the person, and the system cannot re-join them afterwards even for an administrator.

93%

Website & Page Builder

to build

The storefront itself, built by dragging sections into place rather than by editing a theme file — hero, product grid, size guide, lookbook, contact form — each block reading live from the catalogue, so a price or a stock state on a landing page is the same number the order screen uses instead of a figure someone pasted in and forgot. Blog & Pages above writes articles into a site that already exists; this is for the businesses that do not have one, and it is the gap that shows up plainly when this module list is set beside a mature open-source ERP: they ship a full site builder next to the blog, and until now this did not.

Markdown / Clearance Optimization

to build

The same rule engine that reprices for competitiveness, aimed at ageing stock instead: when to start discounting it and by how much, before it becomes a warehouse write-off rather than a sale at a lower margin.

Social Engagement & Inbox

to build

The replies, comments and messages that arrive on the accounts the business posts from, in one queue rather than four apps on somebody's phone. Distinct from the Social Calendar, which decides what goes out: this is what comes back, and it is where a complaint first appears in public. A message here can become a Helpdesk ticket with the thread already attached, so a public question and a private one end up in the same place.

AI Content Engine

MODULE 18

8 APPS

Write it, shoot it, cut it — from your own catalogue

Listings, ads, reels and product photography generated from your own designs, in a voice that sounds like one person from Surat rather than a template — so the words match the piece and the picture is the size Myntra actually wants.

Fourteen stages in your own voice — buyer psychology, competitor reading, hooks, the product description, marketplace copy for Amazon and Myntra, ad variations, reel scripts, song lyrics for the reel, the calendar, size chart and alt text.

Image Studio

to build

A phone photo becomes a listing image: layers, free transform, background removal, Myntra 1080×1440 and every other channel preset, watermark and SEO alt text.

Video Studio

to build

Text and image to video, reels and ad cuts sized for every channel.

Design Studio

to build

Banners, festive creatives and thumbnails — templates, layers, undo and redo, any colour, exact sizing and stock elements, exporting PNG, JPG or PDF at whatever size the panel or the printer asks for.

Motion Renderer

ENGINE WORKING · SCREEN TO COME

A reel rendered from a page of HTML and CSS — the same layers, fonts and brand colours the Design Studio already uses — into a real MP4, on this machine, with nothing uploaded. It is not a screen recording: the clock is faked, the animation is seeked to the exact instant of each frame, and only then is that frame captured, so the render does not care whether the machine was busy. Rendering the same festival banner twice produces the same file to the byte, which is what makes a reel something you can check and re-cut rather than something you have to watch all the way through and hope about.

Narration Studio

to build

A voice over the reel, in the language the buyer actually speaks — the same script the Content Engine wrote, spoken. The default needs nothing installed and no key, because every modern browser can already speak; a self-hosted or cloud voice sits behind it as an interchangeable provider for anyone who wants a cloned or branded one. Long scripts are split at sentence boundaries and rejoined, so a two-minute description is not cut off at whatever limit a service imposes. A voice cloned from a real person is only ever used with that person's recorded consent, filed against them in Data Privacy & Consent like any other permission.

Image Generation Slot

to build

Generated imagery — a model on a background you do not have to shoot, a festival backdrop, a lifestyle scene — as a capability with interchangeable providers rather than a bet on one service: a queue of jobs, a preview while it works, inpainting to fix one region, upscaling and face correction. This one needs a graphics card. Image models cannot run on an ordinary office machine or on the container this system is built in, so what ships is the queue, the review screen and the provider slot, with the generating itself done by whichever engine you point it at — your own GPU box, or a cloud service, swapped without touching anything else. Said plainly here because the alternative is a screen that looks finished and produces nothing.

Publisher

to build

One push sends the listing, images and copy to the website and every panel, and reports back what went live and what a panel rejected, with the reason.

SEO, AEO & AIO

MODULE 19

3 APPS

Be found by a search box, an answer box and an AI

Content already exists once this module is reached; here it is made findable — by a traditional search engine, by the answer box above the results, and by the AI assistants now answering shopping questions directly instead of sending someone to a results page.

Technical SEO & Schema

Answer-Engine Optimization

AI-Engine Visibility Tracking

Technical SEO & Schema

to build

Structured data, sitemaps and page-level technical checks against your own storefront and content pages, so a search engine can read what a page is actually about instead of guessing from the text alone.

AI-Engine Visibility Tracking

to build

Whether and how this business is actually cited when someone asks an AI assistant a shopping question in this category, tracked over time — the same discipline as rank tracking, aimed at a newer kind of result page.

Answer-Engine Optimization

to build

Content shaped to be quoted directly by an answer box or a voice assistant — a clear, citable answer near the top of the page — rather than written only for a person to scroll through.

Projects & Collaboration

MODULE 20

7 APPS

The work that is not an order — and the talking around it

An exhibition in Hyderabad, a boutique's custom order, a new godown fit-out, a legal matter with a supplier. Work that is not a sales order still has a deadline, a cost and documents — and it belongs on the same records as everything else.

Projects & Cases to build

An exhibition, a custom order for a chain, a fit-out or a dispute — stages you define, owners, deadlines, documents, hours and real cost, all on one record the ledger can see.

Approvals to build

One queue for everything waiting on a yes: a mill purchase order, a boutique discount, a leave day, a credit note, a payment. The rule that sent it there is next to it, and the decision goes on the record.

Automation Studio to build

The place a person builds “when this happens, do that” by dragging it out and watching it run — a trigger, the steps after it, a branch where the answer decides which way to go — over the same event stream every module already writes to. Marketing’s Automation aims that idea at campaigns; this is the general one, reaching any module: a payment marked short holds the next dispatch and opens a claim, a karigar’s pooled sets crossing a threshold raises the payout for approval, a return marked damaged writes off the piece and messages the buyer. Every run is kept — what fired it, each step, what each step returned — because an automation nobody can inspect afterwards is a rule the business cannot trust with its money.

Knowledge Base to build

A searchable internal wiki of standard operating procedures, scoped to the role it applies to, so how a task is meant to be done is written down once instead of carried in one person’s head.

Timesheets & Planning to build

Who is on what this week and the hours that actually went in — against a project, an exhibition or a machine — with billable and non-billable kept apart.

Forum to build

Questions and answers that outlive a chat — for customers, dealers or staff — with the useful ones kept where the next person will actually find them.

Discuss to build

The conversation attached to the record it is about — this order, this mill bill, this dispute — so a year later the reason for the decision is still sitting beside it.

Dashboard & BI MODULE 21 9 APPS

See the whole house without asking anyone

Every number rolls up here as work happens — the day’s marketplace orders, what the karigars finished, what is still lying at the dyer, what the mills are owed. No exports, no waiting for month-end.

CEO Dashboard WORKING TODAY

Cash, sales by channel, stock by design, profit per piece and the alerts that matter — one screen, refreshed as the day runs.

Group Consolidation WORKING TODAY

Ethnic Fashion, Vastrangam and Adini Couture as one set of figures, inter-company transfers removed, so the group position is real rather than three spreadsheets added together. Adini Couture has no registration of its own and mainly does job work — it still counts in the group, without being pulled into a return it does not belong in. Add the fourth company the day you open it.

Report Builder WORKING TODAY

Drag the fields you want into a report and save it for the whole team.

Excel Dashboard Builder to build

A full workbook — financial summary, HR, purchase, sales, inventory and production, GST, expenses — generated from the live records behind every other screen, with each company shown as its own row and a consolidated row that is a formula over them, never a separately typed total.

ESG / Sustainability Reporting

to build

Water usage, chemical compliance, waste and packaging, reported from the same certificate and audit records Quality & Compliance already keeps — so a sustainability report is a query over evidence already on file, not a separate exercise assembled once a year from scratch.

Pipelines & Enrichment

to build

The scheduled movement of data into that shape, and the step that fills in what a record was missing from somewhere else. Enrichment is the part that needs care: a field filled in from an outside source has to stay visibly different from one the business entered itself, or a guess quietly becomes a fact in next quarter's report.

Embedded Analytics

to build

A report placed inside another screen, or inside somebody else's system, rather than opened from the reports list. It reads through the same permissions as everything else, so an embedded view can never show a viewer more than they could have seen by opening the report directly — which is the mistake that makes embedding dangerous when it is bolted on afterwards.

Data Warehouse

to build

Somewhere shaped for asking questions rather than for recording transactions. Honestly premature: a warehouse is what a business builds when queries against the live records start hurting, and nothing here has ever run at a volume that could hurt. It is named so the specification has a home for it, and ranked as what it is.

Maps & Geospatial Views

to build

Figures drawn on a map instead of in a column, for the questions that are actually about geography — where the orders come from, where the returns concentrate, which routes cost what. One visualisation type among many, listed separately in the specification and kept separate here because it needs location on the records before it can show anything at all.

AI Assistant, Agents & Automation

MODULE 22

7 APPS

Ask the house a question — and let the routine work run itself

Last for the same reason Dashboard & BI is late: something that answers questions about the whole business can only be built once the whole business is in one place. Three different things live here and the difference between them matters. An ASSISTANT answers a question you asked, from the records, with the records attached. A CHATBOT holds the same conversation with your customer instead of you. An AGENT is given a job rather than a question and works out the steps itself. That last one is what separates this module from Automation Studio in Module 20, where a person draws the steps in advance and the rule runs the same way every time; and from Automation in Module 17, which fires marketing campaigns and nothing else. Both of those stay exactly as they are — this module sits above them and calls them, rather than replacing either. Module 18 writes content; this module answers and acts.

Agent Guardrails & Run Log

Knowledge & Retrieval

Voice In and Out

Corrections & What It Has Learned

AI Assistant

to build

Ask in your own words — “what did Myntra actually pay us last week, and what is still short?”, “which designs did Kalamandir return most” — and get the answer with the rows it came from underneath it, each clicking through to the record. It reads the same ledger and the same settlement lines the accounts screen reads, so its figure and the books agree. When it cannot find the answer it says so; it never puts a plausible number in place of a real one.

AI Agents

to build

A job rather than a question: “chase every unmatched payout line from last week and draft the claim for each.” It works out the steps and stops where a person has to decide. Filing the claim, moving money, changing a price or messaging a boutique all wait for your yes.

AI Chatbot

to build

The same engine facing your buyer, on the website and on WhatsApp: where is my order, will the L fit me, I want to return this saree. It reads the real order and the real size chart, not a script written last season, and it says “let me get someone” for anything about money or a complaint — handing over into the Surat helpdesk queue with the whole chat already attached. It never asks a buyer for a card number, a bank detail or a password.

Agent Guardrails & Run Log

to build

What each agent is allowed to touch, written down as a scope rather than trusted to a prompt, and every run recorded step by step: what started it, what it read, what it proposed, what a person approved, what it actually changed. Kept in the same audit trail as everything else, with the same absence of an off switch. An agent whose working nobody can inspect afterwards is not a colleague, it is an unexplained entry in the books.

 Knowledge & Retrieval to build

The index that makes the answers grounded: your own designs, rate cards, settlement files, standard procedures and past decisions, searchable so a reply quotes what is actually on file instead of what a model remembers about the trade in general. Permission-scoped at the row, so two people asking the same question get answers drawn only from what each of them may already see.

 Voice In and Out to build

The same assistant asked out loud and answering out loud, because the people who most need a figure are often holding something in both hands. A question spoken in the language the speaker actually uses becomes the same query the typed assistant would have run, and the answer comes back as speech with the rows still attached for anyone who wants to look at them. It refuses exactly what the typed one refuses: it will not read out a figure it could not find, and it will not take a password, a card number or a bank detail by voice — a spoken channel does not get an exception to a promise the rest of the system keeps.

 Corrections & What It Has Learned to build

When the assistant gets something wrong, the correction is a record rather than a conversation that scrolls away. Somebody says what the right answer was, that sits against the question it belongs to, and the next person asking gets the corrected version with a note of who corrected it and when. The whole list is readable and editable by the business — not a hidden memory quietly steering answers — so a correction made in haste can be found and undone. Nothing here changes the model; it changes what the model is shown, which is the only kind of learning anybody can audit afterwards.

 Developer Platform MODULE 23 9 APPS

Let other software talk to this one — and build on it

One decision, not twenty-five: whether anything outside this system may call it. Twenty-five lines of the specification are that single capability written out from four different places, which is why it stands as a module instead of a feature buried in Platform. A versioned surface with keys and rate limits, webhooks going out, functions running on top, and only then a builder that lets somebody assemble a screen without writing code. The order matters, because a builder over nothing is a demonstration. The sign-on model has to be settled before any of it: changing how a caller proves who it is afterwards means reissuing every credential ever handed out.

 API & Access Keys to build

A versioned surface over the records this system already keeps, with a key per caller, a rate limit per key, and a log of what each one asked for. Versioned from the first release rather than the third, because the moment an outside system depends on a response shape, changing it silently breaks somebody else's software at a time nobody chose. A key is scoped to exactly the records its holder may already read, so this can never become a way around the permissions every screen obeys.

 Webhooks to build

The other direction: this system calling out when something happens rather than waiting to be asked. A subscription names the event and the address to post to, deliveries are signed so the receiver can tell a real call from a forged one, and a failed delivery is retried on a widening interval and then parked where somebody can see it instead of being dropped. Every attempt is recorded, because an integration that silently stopped firing is worse than one that never worked at all.

 Functions & Scripting to build

Small pieces of logic that run inside the system — when a record changes, on a schedule, or when an automation calls them. Each runs with a time limit, a memory limit and the permissions of whoever or whatever triggered it, so a script can never read what its author could not. What a function did lands in the same audit trail as everything else.

 Low-code App Builder to build

Assemble a screen and the record behind it by dragging fields rather than writing code, for the cases a trade needs and nobody anticipated. What it produces is a configuration row, exactly as an industry pack is, and never a separate copy of the software — so an assembled screen still obeys company scoping, the audit trail and every guarantee the rest of the system makes.

 Builder Data Model to build

The tables and relationships a built application stands on: what a record is, which other records it points at, and which fields may not be empty. Kept separate from the builder because the data model is the expensive half to change later — a screen can be redrawn in an afternoon, a relationship that was wrong has to be migrated with all the rows already sitting in it.

 App Versioning & Release to build

A built application has versions, somewhere to try one before it goes live, and a way back. Without this the person who assembled a screen is editing the live system at the exact moment they are still learning it, which is how a business loses a day of entries.

Developer Console

to build

One place to see what the platform is doing for a given caller: keys issued, calls made, webhooks delivered or failed, functions run, and what each one cost. Somebody debugging an integration at two in the morning should not have to ask a person for a log.

App Marketplace

to build

A directory of applications built on this platform that a business can install into its own company, with what each one may read and write shown before installation rather than discovered after it. Nothing installs without somebody first seeing the scope it is asking for.

Robotic Process Automation

to build

Driving another system that offers no interface of its own by working its screens the way a person would. It is the least reliable way to connect anything, and worth having only when the alternative is somebody retyping figures every morning — so it is recorded here as a last resort with a run log proving what it actually did, never presented as equivalent to a real connection.

Agile & Sprints

MODULE 24

4 APPS

Plan work in iterations, and see what actually got done

Thirteen lines of the specification that amount to one board, one boundary and one chart. It sits beside Projects & Collaboration rather than inside it because a task list and a sprint are different disciplines: a task is either done or not, while a sprint asks how much a team reliably finishes in a fixed period and holds that answer against the last one. A business running a factory may never want any of this, which is precisely why it is a module that can be left switched off instead of something bolted onto the task list everybody uses.

READS FROM

Projects & Collaboration

HR & Payroll

WRITES TO

Projects & Collaboration

Product Backlog & Stories

Product Backlog & Stories

to build

The queue of work that has not been started, written as something a person wants rather than a task somebody was handed, grouped under the larger outcome it belongs to and sized relative to the others. Sizing is deliberately relative and not in hours, because the one thing teams estimate consistently is whether a piece is bigger than another piece.

Velocity & Burndown

to build

How much this team actually finishes per period, and how the current one is tracking against what remains. Both are read from the board rather than typed by anybody, which matters because a progress figure a person types is a figure a person can round.

Sprints & Boards

Sprints & Boards

to build

A fixed period with a set of work committed to it, and a board showing where each piece has got to. The boundary is the point: work added midway is visible as having been added midway, so the difference between what was planned and what was delivered stays legible instead of being quietly absorbed. Planning at the start and a review at the end are part of the same record, not meetings held somewhere else.

Release Planning

to build

Which finished work goes out together and when, drawn from what the sprints have actually completed rather than from what was hoped for at the start. A release date derived from delivered work is the only kind that survives contact with the second sprint.

Meetings

MODULE 25

4 APPS

Who is invited, who came, and what was decided

The half of meetings that is not live video: who is invited, when it is, who attended, what was decided, and a poll or a question queue while it runs. The video itself needs media servers, bandwidth and relays, which a business rents rather than builds, so it is recorded as a constraint instead of a module. Separating the two is the whole idea — the useful and durable half does not need the expensive half, and a decision nobody wrote down is lost whether or not the call was recorded.

CRM

Calendar

HR & Payroll

WRITES TO

CRM

Calendar

- Meeting Scheduling
- Participants, Co-hosts & Moderators
- Polls & Q&A
- Call & Meeting Analytics

Meeting Scheduling

to build

Proposing a time, holding the slot, and letting people say whether it works before it is fixed. It reads the same availability the Calendar module keeps, so a meeting cannot be booked into a time the system already knows is taken.

Participants, Co-hosts & Moderators

to build

Who is invited, who may run the session, and who may quiet it down. Three separate roles rather than one, because the person who owns the meeting is often not the person who should be managing a room of forty people while also presenting to them.

Polls & Q&A

to build

A question put to everyone with the answers counted, and a queue of questions from the floor that can be ordered by how many people want the same one asked. Both outlive the call: the result is attached to the meeting record rather than disappearing when the window closes.

Call & Meeting Analytics

to build

The record of contact — that a call or a meeting happened, with whom, about which account, and what came out of it — filed against the customer or the project it concerned. This is the half with lasting value: six months later nobody needs the recording, they need to know what was agreed and by whom.

Calendar

MODULE 26

4 APPS

Events, invitations and who is actually free

Eleven lines of the specification that are genuinely one thing. Recurring events and time zones are where the real difficulty sits, and both are solved problems reached for from a library rather than reasoned about from first principles — an event repeating on the last working day of a month, moved once, in a zone that shifts its offset twice a year, is the kind of thing that must never be written by hand twice. Syncing to an outside calendar needs that provider's credentials and is a constraint; a calendar of this system's own is not.

Events moved by a daylight-saving change0%

- Events & Recurrence
- Invitations, Availability & Time Zones
- Shared & Team Calendars
- Resource Booking

Events & Recurrence

to build

A dated entry with the people it concerns, and the rules for one that repeats. A single occurrence of a repeating event can be moved or cancelled without disturbing the rest of the series, which sounds small and is the difference between a calendar people trust and one they quietly stop using.

Invitations, Availability & Time Zones

to build

Asking somebody to an event, tracking whether they answered, and showing when they are genuinely free. Every time is stored as an absolute moment and displayed in the reader's own zone, so a meeting set across two countries means the same instant to both of them and survives a daylight-saving change landing between the booking and the day.

Shared & Team Calendars

to build

A calendar belonging to a group rather than a person, with control over who may see a full entry and who may see only that the time is taken. The distinction matters: a team usually needs to know somebody is busy without being told what about.

Resource Booking

to build

The things that get double-booked as often as people do — a room, a vehicle, a machine, a piece of equipment. Held as a bookable record with the same conflict checking an invitation gets, because a room with two meetings in it is the same failure as a person with two.

Mail

MODULE 27

5 APPS

Sort, route and answer what arrives

The reading and organising half of email. Hosting a mail domain is a constraint rather than a task — deliverability and sending reputation are infrastructure a business rents and earns over months — but once a mailbox exists somewhere, filtering it, routing it and answering it from one place is ordinary work. It stands apart from the Helpdesk in CRM on purpose: a ticket is a thing with an owner and a resolution, while a mailbox is a stream, and pretending the stream is a queue is how genuine questions end up closed unanswered.

- Mail Admin Controls

Shared Inbox

to build

One mailbox several people work, with it visible who is dealing with what so two of them do not answer the same message differently within a minute of each other. An address a business publishes belongs to the business, not to whoever happens to have the password for it.

Folders, Labels & Search

to build

Filing, tagging and finding, including inside what is attached. Search is listed last in the specification and is the one people actually use all day, which is worth saying out loud when deciding what to build first.

Filters & Rules

to build

What happens to a message automatically on arrival: filed, tagged, sent on to somebody else, or pulled to the top. Every rule that fired is visible on the message, because a mail that quietly vanished into a folder somebody forgot they created is indistinguishable from a mail that was never sent.

Mail Admin Controls

to build

Who may open which mailbox, what is retained and for how long, and what may leave the organisation. This is the half that makes a shared mailbox safe to use for anything a business would mind losing.

Signatures & Auto-reply

to build

The block appended to what goes out, and the answer sent while somebody is away. The away message names who to contact instead, so an absence routes the sender somewhere rather than simply telling them to wait.

Documents

MODULE 28

5 APPS

Write it, present it, and keep every version

A word processor, a presentation tool and notes. Eight lines of the specification that are in truth three substantial products, listed as though they were features — and this module says so rather than implying they are a fortnight of work. Honestly assessed it is the worst effort-to-value ratio anywhere in the design: every business already has these, and nobody adopts a business system for its word processor. It is written down as a named home so the specification is not silent about it, and it is ranked accordingly.

Word Processor

to build

Writing a document inside the system so it is filed against the record it concerns instead of living on somebody's laptop. The value is not the editor, which is a solved and crowded problem — it is that the document is attached to the order, the case or the person it is actually about.

Presentations

to build

Slides, for the same reason and with the same honest caveat: the point is where the file lives and what it is linked to, not that this is a better tool than the one already on every desk.

Notes

to build

Short-form writing that is not a document — a thought against a customer, a decision against a project. The format most used and least specified, which is usually a sign it should be built before the two above it.

Co-editing & Track Changes

to build

Two people in the same document without one of them overwriting the other, and a visible record of who changed what so an edit can be accepted or undone. This is the genuinely hard part of all three applications above, and the part a business actually notices missing.

Version Recovery

to build

Getting back what a document said before somebody changed it. Listed once in the specification under storage and worth its own line here, because it is the feature nobody asks for until the first afternoon it is needed.

Teach a process, and know who has been taught it

Course material, the lessons inside it, an assessment at the end, and a record of who has completed what. Eight lines that are one straightforward application over data HR & Payroll already holds about who works here. Genuinely useful on a factory floor, where a machine or a process has to be taught and the record of who was taught it is what a compliance audit asks for — which makes this the one module in this group with an obvious near-term case.

READS FROM HR & Payroll

Quality & Compliance

WRITES TO HR & Payroll

Courses & Lessons

Assessments

Learning Paths & Progress

Courses & Lessons to build

The material somebody has to work through, in the order it makes sense, in the language the person being taught actually reads. Built over the staff records that already exist rather than a second list of people maintained beside them.

Learning Paths & Progress to build

A sequence of courses for a role, and who is where in it. The record that matters for compliance is this one: not that training was offered, but that a named person completed it on a date, and that the record can be produced when somebody asks for it.

Assessments to build

A check that something was understood, at the end of a course or as part of hiring. The same mechanism serves both, which is why the specification lists it twice and this design does not build it twice.

Connect to other systems without writing a connector each time

The connector framework, deliberately separate from any individual connector. The framework can be built and tested against recorded responses and needs nobody's credentials; the connectors themselves each need a live account and are constraints rather than tasks. It only becomes sensible after the Developer Platform exists, because a connector framework with nothing underneath it has nothing to offer the thing it connects to.

Integration Webhooks & APIs

Triggers & Actions to build

The two halves of any integration: something that starts it, and something it then does. Kept as one app because they are meaningless apart — the whole design is that any trigger can drive any action without either knowing what the other is.

Connector Library to build

A described connection to a named outside system, with how it proves who it is, how often it may be called and its quirks written down once instead of rediscovered by each person who integrates it. A connector nobody can run without credentials still has value as a specification of what connecting would take.

Integration Webhooks & APIs to build

The framework's own way in and out, distinct from the product surface in the Developer Platform: this is how a connector receives a push from the far side and how it calls back. Separated because the two have different audiences, and conflating them is how an internal mechanism accidentally becomes a public promise.

Identity & IT

MODULE 31

4 APPS

A second factor, and the internal-IT half of the specification

Four lines that are two quite different things, and the split is worth stating. A second proof at sign-in is small, standard, and should exist before anybody signs in over the internet at all — it is the one item here that matters for a real deployment. The other three are a product for IT departments, which a manufacturer is not. Naming them in one module rather than scattering them keeps that distinction visible, instead of letting a genuine near-term need sit in a queue behind three things nobody has asked for.

Security Analytics

Second Proof at Sign-in

to build

A second proof at sign-in beyond a password, with recovery codes for the phone that gets lost and a policy for who must use it. The smallest item in this module and the only genuinely urgent one: a system reachable from the internet with a single factor is a system waiting for one reused password to matter.

IT Service Desk

to build

Internal requests — a laptop, an account, access to something — as tickets with an owner and a resolution. The same shape as the customer Helpdesk in CRM, pointed inward, and honestly a different product from the one this system is for.

Password & Secret Management

to build

Where shared credentials live so they stop living in a message thread, with who may retrieve which one recorded. This system never asks for a marketplace, bank or account password of its own; this app is about the credentials a business already has to hold for other things, and the fact that they are currently held badly.

Security Analytics

to build

Sign-ins, failures and unusual patterns, read from the audit trail that already records everything. It needs no new capture because the record is already being kept — what is missing is anybody looking at it, which is what this app would be.

HOW IT IS KEPT STRAIGHT

The rules, the checks, and what we will not claim.

Software that runs a business earns trust by being checkable, not by being described well. These are the standards this build is held to — written down, because a standard nobody wrote down is a standard nobody can be held to.

The rules that hold everywhere

Integrity

- ✓ No app depends on any single outside company — every capability has interchangeable providers and a by-hand option

What it refuses to do

Safety

- ✓ Never asks for a marketplace, bank or account password — scoped, revocable keys only
- ✓ Nothing is deleted, only deactivated — history must still

How it is verified

Evidence

- ✓ The arithmetic runs with no screen involved, against seeded data
- ✓ Every screen and every control is clicked in a real browser — any

What we will not claim

Honesty

- ✓ Nothing is called finished that is not — every app above is marked working today or to build
- ✓ Counts are counted from the source at build time, never typed

- ✓ A provider named as the source of a figure is a bug; the ledger originates numbers
- ✓ The books are this system's own — no other accounting package is ever required
- ✓ Money is integer paise, never a floating-point number
- ✓ Salaries, prices, tax rates and commissions are effective-dated — March payroll uses March's salary
- resolve
- ✓ The audit trail has no off switch: 8 years, before-and-after values
- ✓ Gates, not warnings — a COD order cannot be packed below its advance, a bill for more than was accepted cannot be paid
- ✓ It is not trained, it is built — no model learns from your data
- console error fails the build
- ✓ Not "did the button click" but "did the thing happen"
- ✓ Against the owner's own figures — and where a source file has since changed shape, the gap is named, not hidden
- ✓ The shipped archive is re-tested after extraction, not just the working copy
- by hand
- ✓ If a test fails, the failure is shown with its output
- ✗ The 16 working apps still run on their own storage — rewiring them onto the shared core is the first job of Module 01
- ✗ 147 apps are designed and specified, not yet written; 2 more have a working engine but no screen on it yet

BUILT DEEP, NOT WIDE

The controls that pay for the software

Three-way match

A supplier bill only passes when the purchase order, the goods receipt and the invoice agree on price and quantity. Bills that over-charge or over-bill rejected goods are held automatically, with the reason in plain language.

Vendor risk that sees ahead

Risk blends weak performance, spend concentration and overdue bills. Your *best* supplier still flags medium risk when 44% of your buying sits with them — the fact worth knowing before a disruption, not after.

Settlement reconciliation

Import a marketplace settlement, match it to the orders, and see every commission, TCS deduction, weight discrepancy and short payment — with a claim pack ready to file.

Karigar piece-rate

Pooled set completion, per-garment rates, alteration hours and advances roll into each karigar's payout — and into a true cost per piece for every design.

One stock number

One quantity per SKU per location per stage, pushed to every channel. Overselling stops being a monthly apology.

AI studio built in

Listings, ad copy, product photography and reels generated against your own catalogue — not a bolted-on chatbot, but the same data core.

INDUSTRIES

Built on the neutral engine, dressed for this trade

Every screen you are about to read runs on one industry-neutral engine. Only the master data and the words change — which is exactly why a machine shop or a law firm could run the same code.

What is different here

Fabric in metres and pieces in numbers on the same item master. Karigar piece-rate with pooled set completion. Design-wise costing to the paise. HSN 5007 / 5208. Wrong-return dead stock treated as the loss it is.

The channels you actually sell on

Myntra, Flipkart, Ajio, Amazon, Meesho, Nykaa and JioMart in one queue, plus the Surat counter, the boutique wholesale book and export to the Gulf — all writing to the same order table.

The people who make it

Cutting, stitching, embroidery, finishing and checking as stages you set. Karigars paid by the piece, staff paid by the month, both in one register and one payout.

The compliance you file

GST on ethnic wear slabs, TCS the marketplaces deduct, TDS on job work, LUT bond and IGST refund on export — all worked out from the same vouchers.

COMPARISON

Vastrangam BOS vs. a suite of integrated apps

The difference is architectural, not cosmetic.

CAPABILITY	VASTRANGAM BOS	TYPICAL SUITE
Architecture	One app, one data core	Many apps, integrated
Master data	Single Item & Party record	Duplicated per app, synced
Stock truth	One number per SKU × location	Per-app, reconciled nightly
Cross-module posting	Instant, via event bus	Scheduled sync jobs
Marketplace settlement	Reconciled to order line + claim pack	Usually a separate tool
Piece-rate manufacturing	Built in	Custom development
AI content & imaging	Native, on your catalogue	Third-party add-on
Offline capability	Single-file apps run offline	Cloud-only

TRUST & SECURITY

Your credentials are never the key

Scoped keys only

Marketplace, bank and courier connections use revocable, scoped API keys held in an AES-256-GCM vault. Vastrangam BOS never asks for, uses or stores an account password.

Isolation by row

Every record carries a company id and is enforced by PostgreSQL row-level security. Group companies stay separate but consolidate on demand.

Immutable audit

Every posting, price change and permission grant is written to an append-only trail with actor, timestamp and before/after values.

THE GAP

Three categories of software. Nobody sells all three.

You are not short of tools. You are short of one tool that covers all of it — which is why the numbers never agree.

Accounting & ERP suites

a desktop accounting package · a desktop accounting package · a desktop accounting package · a business-suite vendor · an open-source ERP

- ✓ Books, GST, stock, purchase
- ✓ Manufacturing, payroll
- ✗ No marketplace order queue
- ✗ No settlement reconciliation or claims
- ✗ No content, image or video studio

Marketplace OMS platforms

an e-commerce operations suite · EliteSecom · SmartHub

- ✓ Panel orders in one queue
- ✓ Inventory sync, settlement
- ✗ No double-entry books, no GST return
- ✗ No manufacturing, purchase or payroll
- ✗ No content, image or video studio

AI content tools

Writing · image · video generators

- ✓ Copy, pictures, reels
- ✗ Knows nothing about your catalogue
- ✗ No orders, no stock, no books
- ✗ Nothing publishes to a channel
- ✗ Nothing reconciles afterwards

Vastrangam BOS

All three, over one data core

- ✓ Books, GST, stock, purchase, manufacturing, payroll
- ✓ Marketplace and storefront order queue
- ✓ Settlement, claims, returns, packing footage
- ✓ Content, image, design and video studio
- ✓ One record underneath all of it

In an accounting package you will never get a marketplace OMS. In an OMS you will never get your books. In a content tool you will never get either. That is the gap. Vastrangam BOS is built in it.

THE APPROACH

Built deep, not wide

A long feature list is easy. What is hard is the one control that stops the money leaking — so every module ships with one, and refuses rather than warns.

01

Accepted, not ordered

You order 100. 100 arrive. Quality accepts 96. Most systems raise stock by 100 and claim tax credit on 100. Vastrangam BOS raises stock by 96, claims credit on 96, raises a debit note for the 4, and lowers that supplier's accept rate. Automatically.

02

The payout, to the order line

Not "the channel paid ₹49.1 lakh". Which order line was short, by how much, against which published commission rate — with the claim pack already assembled and the packing footage attached.

03

Nothing derived is stored

Outstanding, ageing, promise dates, payouts, on-time percentage and risk are recomputed every time you read them. A stored number goes stale the moment the document under it changes. These cannot.

PRICING

Start free. Pay when it runs your business.

The software puts no ceiling on how many companies you run — your plan does, and you move up when you need to. Two of the 30 modules — E-commerce / OMS and the AI Content Engine — are priced on what you actually use, because an order is work and a piece of content is work.

E-commerce / OMS & AI Content Engine

These two are metered, the way every serious order-management platform prices. You pay for orders that actually shipped and content that was actually produced — not for a seat that sat idle.

E-commerce / OMS

AI Content Engine

PER ORDER PROCESSED

ORDERS A MONTH	PER ORDER	INCLUDED
Up to 1,000	₹2.50	All channels, settlement, returns
1,001 – 10,000	₹1.80	+ claims desk, packing footage
10,001 – 50,000	₹1.40	+ multi-warehouse routing
Above 50,000	On request	+ dedicated throughput

An order is counted once, when it is dispatched. A cancelled or unshipped order is never billed.

PER PIECE PRODUCED

WHAT IS PRODUCED	COUNTS AS	RATE
Channel listing (title, bullets, description)	1 content	₹6
Social post, caption or ad variation	1 content	₹4
Product image · background, resize, preset	1 content	₹3
Reel or video cut, per finished clip	1 content	₹25

Bring your own model key and the rate drops to the platform fee alone — no lock-in, ever.

REQUEST A DEMO

Bring one month of your own data

Sales, purchases and stock for a single month. In forty minutes you will see what your current tools are hiding — the short payouts, the returns nobody costed, the stock that two systems disagree about.

QUESTIONS

Frequently asked

What is Vastrangam BOS?

Vastrangam BOS is a unified ERP made of 30 modules and 165 apps that all read and write one shared data core — Item/SKU, Party, Stock, Ledger and Order. Because the data is shared, a single action such as a goods receipt updates stock, the ledger, quality records and the vendor scorecard at the same time.

How is Vastrangam BOS different from a business-suite vendor or an open-source ERP?

Does Vastrangam BOS support Indian GST?

Which marketplaces does Vastrangam BOS connect to?

Can Vastrangam BOS be used outside textiles?

Is my data safe?

Can I use it without internet?

How long does implementation take?

Stop reconciling. Start running.

See your own numbers inside Vastrangam BOS. Bring one month of sales, purchases and stock — we will show you what your current tools are hiding.
